1 Introduction and functional overview

The Cantsyn module handles the distribution of time information over CAN buses.

Just transmitting the time information from the master to the slaves in a broadcast CAN message has the disadvantage that the time value becomes inaccurate due to CAN specific effects like arbitration and BSW specific delays.

The concept proposes a two-step mechanism:

In a first broadcast message (the so-called SYNC message), the second portion
of the time information (t0r) is transmitted. The transmitting ECU, i.e. the Time
Master, uses CAN low-level mechanisms like the "CAN transmit confirmation" to
detect the point in time (t1r) when the message was actually transmitted, i.e. it
takes a timestamp.

A receiving ECU, i.e. the Time Slave, receives the message and uses CAN low-level mechanisms like the "CAN receive indication" to detect the point in time (t2r) when the message was actually received.

- In a second broadcast message (the so-called Follow-Up (FUP) message), the Time Master transmits the offset between the time information transmitted in the previous SYNC message and the actual detected transmission time. No timestamp is taken for the FUP message, neither on the transmitting nor on the receiving side.
- The Time Slave can now combine the information within the SYNC and within the FUP message and with its previously taken timestamp for the received SYNC message and determine the transmitted time information in a more precise way by just receiving one message and omitting timestamps.

Figure 1.1 shows the CAN Time Synchronization mechanism.

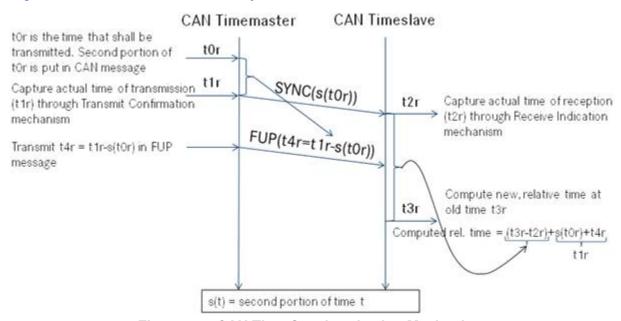

Figure 1.1: CAN Time Synchronization Mechanism

In addition, the CantSyn module supports the distribution of time information over CAN buses with security. The figure below shows the time provider modules interface with the security modules in the AUTOSAR Layered Architecture.

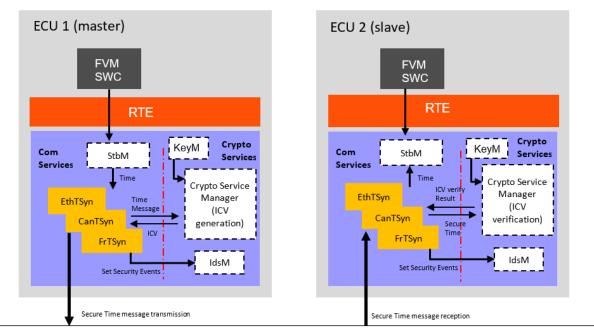

Figure 1.2: Timesync modules interface with security modules in the AUTOSAR Layered Architecture

2 Acronyms and Abbreviations

This section lists module local abbreviations and definitions. For additional Time Synchronization related abbreviations and definitions refer to chapter 3 in the RS Time Synchronization [1]. For general terms and abbreviations refer to the AUTOSAR Glossary [2].

Abbreviation	Description	
GTM	Global Time Master	
BswM	BSW Mode Manager module	
<bus>TSyn</bus>	Bus specific Time Synchronization module	
CAN FD	Controller Area Network (CAN) - Flexible Data Rate	
CanTSyn	Time Synchronization over CAN module	
CRC	Cyclic Redundancy Checksum	
CSM	Crypto Service Manager	
Debounce Time	Minimum gap between two TX messages with the same PDU	
Det	Default Error Tracer module	
DLC	Data Length Code	
DoS	Denial of Service	
Canlf	CAN interface module	
FUP message	Follow-Up message	
FV	Freshness Value	
FVM	Freshness Value Manager	
ICV	Integrity Check Value	
MAC	Message Authentication Code	
OFNS message	Offset adjustment message	
OFS message	Offset Synchronization message	
OVS	Overflow Seconds value (field in FUP message)	
SC	Sequence Counter in Time Synchronization messages	
SGW	"Synchronized to Gateway" state of Time Synchronization	
StbM	Synchronized Time-Base Manager	
SYNC message	Time Synchronization message	
Timesync	Time Synchronization

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [3, SWS BSW General], which is also valid for Cantsyn.

Thus, the General Specification on Basic Software (SWS BSW General) shall be considered additionally and as required specification for CantSyn.

4 Constraints and assumptions

4.1 Limitations

- 1. The Time Base in the SYNC and OFS messages is limited to 32 bit, wherefore the maximum supported time value is 4294967295 seconds (2³²-1).
- 2. Time Masters, Time Gateways and Time Slaves shall work with a Time Base reference clock with a worst-case accuracy of 2μ s.
- 3. The authentication protection mechanism of the time is not supported on classic CAN busses, due to below reasons.
 - The authentication protection mechanism is complex to achieve on classic CAN busses due to payload limitation and any solution incorporated will leave the security vulnerabilities (e.g., cryptographic attacks, DoS).
 - Today's ECUs in vehicle E/E architecture supports both classic CAN and CanFD channels.

4.2 Applicability to car domains

Automotive systems requiring a common Time Base for ECUs regardless of which bus system the ECUs are connected to.

5 Dependencies to other modules

The Time Synchronization over CAN (CantSyn) has interfaces towards the Synchronized Time-Base Manager (StbM), the CAN Interface (CanIf), the BSW Mode Manager (BswM), the Crypto Service Manager (CSM) and the Default Error Tracer (Det).

Table 6.1: RequirementsTracing

7 Functional specification

This chapter defines the behavior of the Time Synchronization over CAN. The API of the module is defined in chapter 8, while the configuration is defined in chapter 10.

7.1 Overview

The Time Synchronization over CAN is responsible to realize the CAN specific Time Synchronization protocol.

Time Synchronization principles and common wording is described in the SWS Synchronized Time-Base Manager [5] and RS Time Synchronization [1].

7.2 Module Handling

This section contains description of auxiliary functionality of the Time Synchronization over CAN.

[SWS_CanTSyn_00135] [If CanTSyn calls an API of the StbM, it shall use the Time Base ID of the Time Base referenced via the parameter CanTSynSynchronized-TimeBaseRef of the corresponding Time Domain. | (RS TS 20032, RS TS 20038)

7.2.1 Interrupt Handling

When transmitting or receiving a SYNC message, the current value of the Virtual Local Time needs to be captured in the RX indication / TX confirmation callbacks

- either in interrupt mode in context of the RX / TX interrupt
- or in polling mode in the main function (Note: it is strongly recommended not to use polling mode for Time Slaves).

Any delay between the occurrence of the interrupt itself and the determination of the current Virtual Local Time worsens the precision of either the transmitted or received Time Base.

Therefore, it is inevitable that these RX indication / TX confirmation callbacks establish a protection against interruptions immediately after being called (if called in context of the RX / TX interrupt with interrupt nesting disabled, this is implicitly ensured by the controller).

Thereafter only the necessary checks shall be made to determine that the message is a SYNC message (and to determine the Time Base ID if necessary). Once the Time Base ID and the SYNC message type are confirmed the current value of the Virtual Local Time is obtained from a function call to the StbM (still in the context of locked

interrupts). Afterwards the interruption protection can be removed without having a negative impact on the precision.

As a consequence it might be possible that a snapshot of the Virtual Local Time is taken although the subsequent frame checks (e.g., CRC validation, SC validation) might fail and thus the snapshot becomes superfluous.

7.2.2 Initialization

The Time Synchronization over CAN is initialized via CanTSyn_Init. Except for CanTSyn_GetVersionInfo and CanTSyn_Init, the API functions of the Time Synchronization over CAN may only be called when the module has been properly initialized.

[SWS_CanTSyn_00003] [A call to CanTSyn_Init initializes all internal variables and sets the Time Synchronization over CAN to the initialized state. $|(RS_TS_00003, RS_TS_00004)|$

[SWS_CanTSyn_00007] [The Sequence Counter (SC) shall be initialized with 0.] (RS TS 20033)

7.2.3 Error Handling

[SWS_CanTSyn_00088] [On errors and exceptions, the CanTSyn module shall not modify its current module state but shall simply report the error event.] (RS_TS_20034, SRS_BSW_00323)

7.3 Message Format

SYNC, FUP, OFS and OFNS messages are assigned to a dedicated message type "TimeSync".

SYNC, FUP, OFS and OFNS messages of the same Time Domain share the same CAN ID by using a multiplexed signal group. For different Time Domains the same CAN ID may be used if Timesync messages are sent by the same Time Master or Time Gateway. For different Time Domains different CAN IDs shall be used if Timesync messages are sent by different Time Masters or Time Gateways. The multiplexer is located at byte 0, named as ${\tt Type}$.

The usage of a CRC is optional. To ensure a great variability between several time observing units, the configuration decides of how to handle CRC protected Timesync messages if the receiver does not support the CRC calculation. Hence it might be possible, that a receiver is just using the given Time Base value without evaluating the CRC.

SYNC, FUP, OFS and OFNS messages can be secured by ICV, that provides the integrity and authenticity protection of these messages. The authentication of time is supported for extended CAN only.

The usage of a ICV is optional. To ensure a great variability between several time observing units, the configuration decides on how to handle ICV protected Time Synchronization messages if the receiver does not support the ICV calculation. Hence it might be possible, that a receiver is just using the given Time Base value without evaluating the ICV.

To ensure the greater performance of the system, the ICV is included only in FUP message. However, the data used for ICV calculation includes the payload of SYNC and FUP messages. Similarly for the offset messages, the ICV is included in extended OFS message.

[SWS_CanTSyn_00008] [The byte order for time value signals in Time Synchronization messages is "Big Endian". | (RS TS 20035)

[SWS_CanTSyn_00010] [For classic CAN the DLC of SYNC, FUP, OFS and OFNS messages shall be 8.

For CAN FD, if

- CanTSynUseExtendedMsgFormat **is** TRUE
- and CantsynGlobalTimeTxIcvSecured is ICV_NOT_SUPPORTED
- and CantSynRxIcvVerificationType is ICV NOT VERIFIED,

the DLC of SYNC, FUP, OFS and OFNS messages shall be 16.

For CAN FD, if

- CanTSynUseExtendedMsgFormat is TRUE
- and
 - CanTSynGlobalTimeTxIcvSecured is ICV_SUPPORTED
 - or CantSynRxIcvVerificationType is ICV_IGNORED
 - or CantSynRxIcvVerificationType is ICV_OPTIONAL
 - or CantSynRxIcvVerificationType is ICV_VERIFIED,

the DLC of SYNC, FUP, OFS and OFNS messages shall be variable up to 64.] (RS_-TS_20035, RS_TS_20068, RS_TS_20073)

Depending on the message type and whether CRC protection and ICV verification is supported, the CanTSyn defines the message type field values as given in Table 7.1. For details of the message layout refer to the subsequent sections. What is obvious from the table is, that SYNC, normal OFS and OFNS message are never ICV secured.

Message Type	Message Type	CRC	ICV	Message Layout
Field Value		protected	secured	

0x10	SYNC	no	no	[SWS_CanTSyn_00015]
0x20	SYNC	yes	no	[SWS_CanTSyn_00017]
0x18	FUP	no	no	[SWS_CanTSyn_00016]
0x28	FUP	yes	no	[SWS_CanTSyn_00018]
0x78	FUP	no	yes	[SWS_CanTSyn_00155]
0x88	FUP	yes	yes	[SWS_CanTSyn_00156]
0x34	OFS	no	no	[SWS_CanTSyn_00126]
0x44	OFS	yes	no	[SWS_CanTSyn_00127]
0x3C	OFNS	no	no	[SWS_CanTSyn_00128]
0x4C	OFNS	yes	no	[SWS_CanTSyn_00129]
0x54	Extended OFS	no	no	[SWS_CanTSyn_00111]
0x64	Extended OFS	yes	no	[SWS_CanTSyn_00112]
0x94	Extended OFS	no	yes	[SWS_CanTSyn_00157]
0xA4	Extended OFS	yes	yes	[SWS_CanTSyn_00158]

Table 7.1: Message Types supported by CanTSyn

[SWS_CanTSyn_00011] [Depending on its type Time Synchronization messages may contain User Data according to the given message format. | (RS TS 20035, RS TS 20037)

[SWS_CanTSyn_00012] [User Data shall be read consistently from incoming Time Synchronization messages that contain User Data Fields. | (RS TS 20037)

[SWS_CanTSyn_00013] [User Data shall be written consistently to outgoing Time Synchronization messages that contain User Data Fields.

If the number of User Data Fields in a Time Synchronization message is greater than the number of User Data Bytes provided by the StbM, the remaining User Data Fields shall be set to 0 (default value). [(RS_TS_20037)

[SWS_CanTSyn_00014] [User Data shall be mapped to the StbM_UserDataType, where the byte number given in the message and by the StbM_UserDataType shall match (User Byte 0 mapped to StbM_UserDataType.userByte0, etc.).

StbM_UserDataType.userDataLength shall be set to the Time Synchronization message type specific number of User Bytes. | (RS_TS_20037)

7.3.1 SYNC and FUP Message

The message layout of the normal SYNC and FUP messages is defined by the following requirements:

- [SWS CanTSyn 00015]: "SYNC message format not CRC protected"
- [SWS CanTSyn 00017]: "SYNC message format CRC protected"
- [SWS_CanTSyn_00016]: "FUP message format not CRC protected, not ICV secured"

- [SWS_CanTSyn_00018]: "FUP message format CRC protected, not ICV secured"
- [SWS_CanTSyn_00155]: "FUP message format not CRC protected, ICV secured"
- [SWS_CanTSyn_00156]: "FUP message format CRC protected, ICV secured" depending on whether the payload is CRC protected and/or ICV secured or not.

Note: SYNC messages are not ICV secured.

Table 7.7: FUP message format - CRC protected, ICV secured

(RS TS 20073)

7.3.2 Offset Messages

Offset messages can be multiplexed with the Time Synchronization messages (using the same PDU, etc.).

For Classic CAN (CAN 2.0) two different Offset messages are used, OFS and OFNS. For both of them there are variants with and without a CRC field.

For CAN FD, if CantSynUseExtendedMsgFormat is TRUE, the content of OFS and OFNS is merged into a single Extended OFS message (variants with and without a CRC field exist as well). Also, there are variants with and without a ICV field.

[SWS_CanTSyn_00132] [CanTSynUseExtendedMsgFormat shall always be FALSE for CAN 2.0 buses.|(RS TS 20068)

[SWS_CanTSyn_00130] [If CanTSynUseExtendedMsgFormat is FALSE, then the Normal Offset Message Format shall be used, i.e., Offset Messages with message Type 0x34, 0x44, 0x3C and 0x4C. | (RS TS 20068)

Note: For Normal Offset Message Format refer to chapter 7.3.2.1

[SWS_CanTSyn_00131] [If CanTSynUseExtendedMsgFormat is TRUE, then the Extended Offset Message Format shall be used, i.e., Offset Messages with message

Type 0x54, 0x64, 0x94 and 0xA4.](RS_TS_20068)

Note: For Extended Offset Message Format refer to chapter 7.3.2.2

7.3.2.1 Normal Offset Messages

The message layout of the normal OFS/OFNS messages is defined by the following requirements:

- [SWS CanTSyn 00126]: "OFS message format not CRC protected"
- [SWS CanTSyn 00128]: "OFS message format CRC protected"
- [SWS CanTSyn 00129]: "OFNS message format CRC protected"
- [SWS_CanTSyn_00127]: "OFNS message format not CRC protected"

depending on whether the payload is CRC protected or not.

Note: Normal OFS/OFNS messages are not ICV secured.

[SWS CanTSyn 00126]

(RS_TS_20033, RS_TS_20036)

7.3.2.2 Extended Offset messages

The message layout of Extended OFS messages (i.e., for CAN FD PDUs, if CantSynUseExtendedMsgFormat is set to TRUE) is as follows:

- [SWS_CanTSyn_00111]: "Extended OFS message format not CRC protected, not ICV secured"
- [SWS_CanTSyn_00112]: "Extended OFS message format CRC protected, not ICV secured"
- [SWS_CanTSyn_00157]: "Extended OFS message format not CRC protected, ICV secured"
- [SWS_CanTSyn_00158]: "Extended OFS message format CRC protected, ICV secured"

depending on whether the payload is CRC protected and/or ICV secured or not.

A separate OFNS message is not required.

7.4 Acting as Time Master

A Time Master is an entity which is the master for a certain Time Base and which propagates this Time Base to a set of Time Slaves within a certain segment of a communication network, being a source for this Time Base.

If a Time Master is also the owner of the Global Time Base, the Time Base from which all further Time Bases are derived from, then it is the Global Time Master (refer to Figure 7.1). A Time Gateway typically consists of one Time Master port which is connected to one or more Time Slaves. When mapping time entities to real ECUs it has to be noted, that an ECU could be Time Master (or even Global Time Master) for one Time Base and Time Slave for another Time Base.

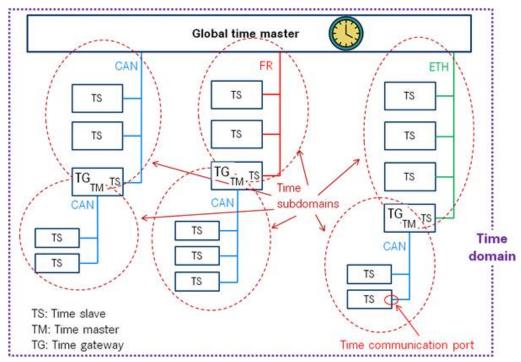

Figure 7.1: Terminology Example

The CanTSyn supports a fan-out of a given Time Base on several CAN busses in parallel. Those busses all belong to the same Time Domain.

Note: A separate configuration container CanTSynGlobalTimeDomain needs to be configured for each CAN bus on which the CanTSyn transmits the Time Base for a given Time Domain - although those busses all belong to the same Time Domain.

Figure 7.2 illustrates the overall flow how a Time Master triggers the transmission of Timesync messages.

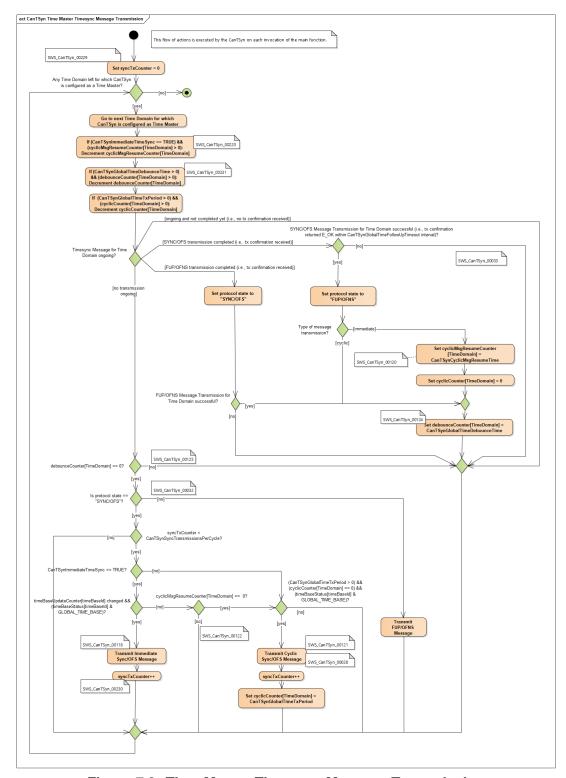

Figure 7.2: Time Master Timesync Message Transmission

The details are given in the following subchapters. Also refer to the sequence diagrams Figure 9.2 and Figure 9.3 for the interaction with other BSW modules during transmission of a SYNC/FUP message sequence.

[SWS_CanTSyn_00136] [A Time Master shall transmit SYNC, FUP, OFS and OFNS messages by calling CanIf_Transmit with the Pduld derived via CanTSynGlobal-TimePduRef of the corresponding Time Domain. | (RS_TS_20031)

7.4.1 SYNC and FUP message processing

[SWS_CanTSyn_00025] [A Time Master shall start each Time Synchronization sequence for a Synchronized Time Base with a SYNC message. | (RS TS 20031, RS TS 20035)

[SWS_CanTSyn_00026] [A Time Master shall finish each Time Synchronization sequence for a Synchronized Time Base with a FUP message. | (RS_TS_20031, RS_TS_20035)

[SWS_CanTSyn_00027] [If a transmission of a SYNC or FUP message fails ($CanTSyn_TxConfirmation$ is called with E_NOT_OK), CanTSyn shall reset the state machine to start with a new SYNC transmission again once it is due.] (RS_TS_20034, RS_TS_20035)

Note: No FUP message will be sent, if the SYNC message transmission fails.

[SWS_CanTSyn_00028] [For a Synchronized Time Domain (refer to CanTSynGlobalTimeDomain) if

- the GLOBAL TIME BASE bit within the timeBaseStatus is set
- and CantSynGlobalTimeTxPeriod is unequal to 0
- and the debounceCounter is 0
- and no transmission of the corresponding PDU is pending (CanTSyn_TxCon-firmation has been called with E_OK or E_NOT_OK)
- and the associated cyclicMsgResumeCounter is equal to or less than 0
- and syncTxCounter (if configured) is less than CanTSynSyncTransmissionsPerCycle,

then a Time Master shall periodically transmit SYNC messages with the cycle CantSynGlobalTimeTxPeriod

The cyclic transmission shall be started in the earliest possible CantSyn_MainFunction call once the requirements above are fulfilled. | (RS TS 20031, RS TS 20035)

Note: "earliest possible" means:

- In the next Cantsyn_MainFunction, because GLOBAL_TIME_BASE is set outside the Cantsyn_MainFunction.
- In the current CanTSyn_MainFunction, when switching from immediate to cyclic transmission (because this decision is made inside the CanTSyn_Main-Function).

[SWS_CanTSyn_00029] [The SYNC and FUP sequence shall not be interrupted, neither by Time Synchronization messages of the same Time Domain nor by Time Synchronization messages of other Time Domains if the same CAN ID is used for the Time Synchronization messages.] (RS TS 20035)

[SWS_CanTSyn_00031] [If the CanTSynGlobalTimeTxIcvSecured is ICV_-NOT_SUPPORTED, then depending on CanTSynGlobalTimeTxCrcSecured the SYNC / FUP message shall be of type:

CanTSynGlobalTimeTxCrcSecured Value	SYNC Message Type	FUP Message Type
CRC_NOT_SUPPORTED	0x10 SYNC message, not CRC protected	0x18 FUP message, not CRC protected
CRC_SUPPORTED	0x20 SYNC message, CRC protected	0x28 FUP message, CRC protected

Table 7.16: Settings of CanTSynGlobalTimeTxCrcSecured for SYNC / FUP messages without ICV

(RS TS 20033, RS TS 20035)

[SWS_CanTSyn_00159]{DRAFT} [If the CanTSynGlobalTimeTxIcvSecured is ICV_SUPPORTED and CanTSynUseExtendedMsgFormat is TRUE, then depending on CanTSynGlobalTimeTxCrcSecured the SYNC / FUP message shall be of type:

CanTSynGlobalTimeTxCrcSecured Value	SYNC Message Type	FUP Message Type
CRC NOT SUPPORTED	0x10	0x78
CKC_NOI_SUPPORTED	SYNC message,	FUP message, not CRC
	not CRC protected	protected, ICV secured
CDC CUDDODTED	0x20	0x88
CRC_SUPPORTED	SYNC message,	FUP message, CRC
	CRC protected	protected, ICV secured

Table 7.17: Settings of CanTSynGlobalTimeTxCrcSecured for SYNC / FUP messages with ICV

(RS TS 20073)

[SWS_CanTSyn_00032] [A transmitter of FUP messages (Time Master) is using as trigger condition for SYNC to FUP that the debounceCounter value reaches 0.] (RS_-TS_20031, RS_TS_20035)

Note: Refer to chapter 7.4.4 for the use of the debounceCounter.

[SWS_CanTSyn_00033] [Each transmission request of a SYNC message shall be monitored for a transmit confirmation timeout.

If CantSyn_TxConfirmation is not called within 2 sec after transmission request, CantSyn shall

• wait until CantSyn_TxConfirmation is called (with E_OK or E_NOT_OK) and

- send no FUP message and
- instead reset the state machine to start with a new SYNC transmission once it is due.

(RS TS 20034, RS TS 20035)

Note: A timeout of 2 sec is used to avoid an overflow of the OVS value in the FUP message (value range: 0 .. 3 sec), if CantSyn_TxConfirmation is called late.

7.4.2 OFS message processing

[SWS_CanTSyn_00035] A Time Master shall start each Time Synchronization sequence for an Offset Time Base with an OFS message. | (RS_TS_20031, RS_TS_20036)

[SWS_CanTSyn_00036] [If CanTSynUseExtendedMsgFormat is FALSE, a Time Master shall finish each Time Synchronization sequence for an Offset Time Base with an OFNS message. | (RS_TS_20031, RS_TS_20036, RS_TS_20068)

Note: If CanTSynUseExtendedMsgFormat is TRUE, OFNS messages are not required.

[SWS_CanTSyn_00037] [If the transmission of an OFS or an OFNS message fails (i.e., CanTSyn_TxConfirmation for the corresponding PDU is called with parameter result set to E_NOT_OK), the state machine shall be reset to start with a new OFS transmission again (once it is due). | (RS TS 20034, RS TS 20036)

Note: No OFNS message will be sent, if the OFS message transmission fails

[SWS_CanTSyn_00038] [For an Offset Time Domain (refer to CanTSynGlobal-TimeDomain) if

- the GLOBAL_TIME_BASE bit within the timeBaseStatus of the referenced Time Base CantSynSynchronizedTimeBaseRef is set
- and CantSynGlobalTimeTxPeriod is unequal to 0
- and the debounceCounter is 0
- and no transmission of the corresponding PDU is pending (CantSyn_TxCon-firmation has been called with E_OK or E_NOT_OK)
- and the associated cyclicMsqResumeCounter is equal to or less than 0

then a Time Master shall periodically transmit OFS messages with the cycle CanTSyn-GlobalTimeTxPeriod.

The cyclic transmission shall be started in the earliest possible CantSyn_MainFunction call once the requirements above are fulfilled. | (RS TS 20031, RS TS 20036)

Note: "earliest possible" means:

- In the next Cantsyn_MainFunction, because GLOBAL_TIME_BASE is set outside the Cantsyn_MainFunction.
- In the current CanTSyn_MainFunction, when switching from immediate to cyclic transmission (because this decision is made inside the CanTSyn_MainFunction).

[SWS_CanTSyn_00039] [The OFS and OFNS sequence shall not be interrupted, neither by Time Synchronization messages of the same Time Domain nor by Time Synchronization messages of other Time Domains if the same CAN ID is used for the Time Synchronization messages.] (RS_TS_20036)

[SWS_CanTSyn_00040] [A transmitter of OFNS messages (Time Master) is using as trigger condition for OFS to OFNS that the debounceCounter value reaches 0.] (RS_TS_20036)

Note: Refer to chapter 7.4.4 for the use of the debounceCounter.

[SWS_CanTSyn_00041] [If the CanTSynGlobalTimeTxIcvSecured is ICV_-NOT_SUPPORTED, then depending on CanTSynGlobalTimeTxCrcSecured the OFS / OFNS message shall be of type:

Bus Type	Value of Parameter	OFS Message	OFNS Message
	CanTSynGlobalTimeTxCrcSecured	Туре	Туре
CAN	CRC_NOT_SUPPORTED	0x34	0x3C
		OFS message,	OFNS message,
		not CRC protected	not CRC protected
	CRC_SUPPORTED	0x44	0x4C
		OFS message,	OFNS message,
		CRC protected	CRC protected
CAN FD	CRC_NOT_SUPPORTED	0x54	Not Applicable
(CanTSyn-		(Ext) OFS message,	
UseExtended-		not CRC protected	
MsgFormat	CRC_SUPPORTED	0x64	
= TRUE)		(Ext) OFS message,	
		CRC protected	

Table 7.18: Settings of CanTSynGlobalTimeTxCrcSecured for OFS / OFNS messages without ICV

(RS TS 20033, RS TS 20036, RS TS 20068)

[SWS_CanTSyn_00160]{DRAFT} [If

- CanTSynUseExtendedMsgFormat is set to TRUE
- and CantsynGlobalTimeTxIcvSecured is set to ICV_SUPPORTED
- and CantsynGlobalTimeTxCrcSecured is set to CRC_NOT_SUPPORTED,

then the type of the OFS message shall be set to 0x94 (i.e., Ext OFS message - not CRC protected, ICV secured)

lf

- CantSynUseExtendedMsgFormat is set to TRUE
- and CantSynGlobalTimeTxIcvSecured is set to ICV SUPPORTED
- and CantSynGlobalTimeTxCrcSecured is set to CRC_SUPPORTED,

then the type of the OFS message shall be set to 0xA4 (i.e., Ext OFS message - CRC protected, ICV secured) | (RS TS 20073)

[SWS_CanTSyn_00042] [Each transmission request of an OFS message shall be monitored for a transmit confirmation timeout.

If ${\tt CanTSyn_TxConfirmation}$ is not called within 2 sec after transmission request, CanTSyn shall

- wait until CantSyn_TxConfirmation is called (with E_OK or E_NOT_OK) and
- send no OFNS message and
- instead reset the state machine to start with a new OFS transmission once it is due.

](RS_TS_20034, RS_TS_20036)

Note: A reset of the state machine in the event of a timeout avoids, that a possibly outdated Offset Time is sent. Instead the latest Offset Time via StbM_GetOffset is retrieved.

7.4.3 Transmission mode

[SWS_CanTSyn_00043] [If CanTSyn_SetTransmissionMode (Controller, Mode) is called and parameter Mode equals CANTSYN_TX_OFF, all transmit requests from CanTSyn shall be omitted on this CAN channel.] (RS_TS_20031, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00044] [If CanTSyn_SetTransmissionMode (Controller, Mode) is called and parameter Mode equals CANTSYN_TX_ON, all transmit requests from CanTSyn on this CAN channel shall be able to be transmitted.] (RS_TS_20031, RS_TS_20035, RS_TS_20036)

7.4.4 Debouncing of Timesync message transmission

7.4.4.1 Debouncing per PDU

The CanTSyn debounces CAN Tx PDUs of a Time Master to avoid bursts of Timesync messages on the bus (e.g. if immediate transmission is enabled). This mechanism also defines the minimum interval between a SYNC and its corresponding FUP message (and between OFS and OFNS messages respectively).

For each Tx PDU the CanTSyn maintains a debounceCounter. On each transmission of a Timesync message the debounce counter is (re-)loaded by the configured debounce time CanTSynGlobalTimeDebounceTime. The counter is decremented in each CanTSyn main cycle. Transmission of the same PDU can only be triggered, if the debounce counter has reached the value 0. Refer also to the overall sequence for the Timesync message transmission in Figure 7.2.

The CanTSyn does not support sharing of PDUs across domains and busses, i.e., the same PDU ID should not be used for different time domains.

However, the CanTSyn supports a separate mechanism to debounce the transmission of SYNC/OFS Messages across CAN busses (refer to chapter 7.4.4.2 "Debouncing across multiple domains and busses").

[SWS_CanTSyn_00123]{OBSOLETE} [If CanTSynGlobalTimeDebounceTime is greater than 0 for a Time Base, CanTSyn shall always do debouncing for the corresponding Timesync PDUs as described below, otherwise CanTSyn shall not do any debouncing.

(RS TS 20031)

[SWS_CanTSyn_00124] [If for a Time Domain

- CantSynGlobalTimeDebounceTime is greater than 0
- and the corresponding Timesync PDU has been successfully sent (i.e., CanTSyn_TxConfirmation for the corresponding PDU is called with parameter result set to E_OK),

then the CanTSyn shall set the PDU specific debounceCounter to CanTSynGlobalTimeDebounceTime (RS_TS_20031)

[SWS_CanTSyn_00231] [If for a Time Domain

- CanTSynGlobalTimeDebounceTime is greater than 0
- and the debounceCounter for the corresponding Timesync PDU is greater than 0,

then the CanTSyn shall decrement the debounceCounter value by CanTSynMain-FunctionPeriod on each invocation of CanTSyn_MainFunction (RS_TS_20031)

Note: Since the decrement of the debounceCounter takes place in the CantSyn_-MainFunction call but the start of the counter takes place when the Timesync PDU has been sent (either in the subsequent CantSyn_MainFunction call or in the transmit confirmation callback function) the effective debounce time will be equal or larger than CantSynGlobalTimeDebounceTime. The extension of the debounce time shall be limited to the value of CantSynMainFunctionPeriod

[SWS_CanTSyn_00125] [If for a Time Domain

• CanTSynGlobalTimeDebounceTime is greater than 0

- and the debounceCounter for the corresponding Timesync PDU is greater than 0
- and a transmission of a TimeSync message is requested,

then CanTSyn shall defer the actual transmission of the Timesync message until debounceCounter is equal or less than $0.|(RS_TS_20031)$

Rationale: While debouncing, a new transmission request should not get lost.

[SWS_CanTSyn_00232] [If for a Time Domain

- CantSynGlobalTimeDebounceTime is greater than 0
- a deferred SYNC or OFS message transmission request is pending
- and a new immediate or cyclic transmission of a SYNC or OFS message is requested,

then the CanTSyn shall discard the pending request for that Time Domain. (RS_TS_-20031)

Rationale: While debouncing, there is no queuing of multiple transmission requests. The latest request is the best one.

[SWS_CanTSyn_00233] [If for a Time Domain

- CanTSynGlobalTimeDebounceTime is greater than 0
- a deferred FUP or OFNS message transmission request is pending
- and a new immediate or cyclic transmission of a SYNC or OFS message, respectively, is requested,

CanTSyn shall defer the transmission of the SYNC or OFS message for that Time Domain. | (RS TS 20031)

Rationale: A SYNC/FUP or OFS/OFNS sequence is not interrupted, i.e., a new SYNC/OFS sequence will not be started until the previous one has been completed.

7.4.4.2 Debouncing across multiple domains and busses

If SW timestamping is used the precision of the Global Time transmitted by the Time Master is affected by the transmission confirmation ISR delay/jitter. The effect increases if the Time Master transmits SYNC messages on various domains/buses, where the transmit confirmation interrupt is handled by the same core. In this case it is likely that several transmit confirmation interrupts are triggered almost simultaneously. As a result any but the first CanTSyn ISR execution gets delayed by the CanTSyn's ISR delay of the 'first' interrupt to be processed and its execution time but also by any other interrupt's ISR which is then processed directly after the first CanTSyn ISR and before the second one (e.g., due to interrupt priority). To avoid such burst transmissions of SYNC messages, the transmissions will be distributed across CanTSyn main

cycles, i.e., the number of simultaneous SYNC message transmissions per CanTSyn main cycle is limited. Refer also to the overall sequence for the Timesync message transmission in Figure 7.2.

[SWS_CanTSyn_00228] [If

- the CanTSyn module is configured as Time Master for at least one Time Domain
- and CantSynSyncTransmissionsPerCycle is greater than 0

the CanTSyn module shall maintain a counter syncTxCounter that counts the SYNC message transmission requests per transmission SYNC message interval CanTSyn-MainFunctionPeriod. | (RS_TS_20031)

[SWS_CanTSyn_00229] [The CanTSyn module shall set the syncTxCounter to 0 at the start of each CanTSyn_MainFunction.|(RS_TS_20031)

[SWS_CanTSyn_00230] [The CanTSyn module shall increment the syncTxCounter by 1 at each call to CanIf_Transmit for a SYNC message. | (RS_TS_20031)

7.4.5 Immediate Time Synchronization

In addition to the cyclic Timesync message transmission, an immediate message transmission might be required. Figure 7.2 illustrates how immediate and cyclic message transmission align.

Depending on configuration, the CanTSyn module checks on each CanTSyn_Main-Function call the necessity for a Timesync message transmission for each Time Base, where a Master Port belongs to.

[SWS_CanTSyn_00117] [If CanTSynImmediateTimeSync is set to TRUE for a Time Base, CanTSyn shall check on each CanTSyn_MainFunction call by calling StbM_GetTimeBaseUpdateCounter, if the timeBaseUpdateCounter of the corresponding Time Base has changed. | (RS TS 20031)

[SWS_CanTSyn_00118] [If

- CanTSynImmediateTimeSync is set to TRUE
- and the timeBaseUpdateCounter of a Time Base has changed
- and the GLOBAL_TIME_BASE bit of the timeBaseStatus is set
- and the debounceCounter is 0
- and syncTxCounter (if configured) is less than CanTSynSyncTransmissionsPerCycle
- no transmission of the corresponding PDU is pending (CanTSyn_TxConfirmation has been called with E_OK or E_NOT_OK),

CanTSyn shall trigger an immediate transmission of Time Synchronization messages for the corresponding Time Base. | (RS_TS_20031)

Note: timeBaseStatus can be obtained by StbM_GetTimeBaseStatus or StbM GetCurrentTime.

In addition, to the actual trigger condition for an immediate transmission (refer to [SWS_CanTSyn_00118] above) the parameter CanTSynCyclicMsgResumeTime needs to be considered for immediate transmission. Refer also to the trigger condition for cyclic Timesync message transmissions (refer to [SWS_CanTSyn_00028] and [SWS_CanTSyn_00038], respectively).

Two main scenarios are relevant for configuration of CantSynCyclicMsgResume-Time:

- With CantSynCyclicMsgResumeTime and CantSynGlobalTimeTxPeriod both being configured as zero, a single shot mode is achieved that is solely triggered by the change of the timeBaseUpdateCounter.
- With CantSynCyclicMsgResumeTime greater than CantSynGlobal— TimeTxPeriod a hold-over scenario in a Time Gateway can be configured:
 - While Timesync messages are received from the Time Master side, the Timesync messages on the sub-busses are only triggered by immediate transmission, as cyclic transmission is suspended while cyclicMsgResumeCounter is running.
 - If no Timesync messages from the Time Master side are received anymore and a timeout is detected, cyclic transmission takes over, as cyclic transmission is no longer suspended because cyclicMsgResumeCounter has elapsed.
 - If reception of Timesync messages from the Time Master side resumes, the Timesync messages on the sub-busses are again triggered by immediate transmission, as cyclic transmission is again suspended because of the cyclicMsgResumeCounter.

[SWS_CanTSyn_00119]{OBSOLETE} [If CanTSynImmediateTimeSync is set to TRUE, cyclicMsgResumeCounter and CanTSynCyclicMsgResumeTime shall be considered.] (RS_TS_20031)

[SWS_CanTSyn_00120] [If for a Time Domain

- CanTSynImmediateTimeSync is set to TRUE
- and CantSynCyclicMsgResumeTime is greater than 0
- and an immediate transmission of a SYNC or OFS message has completed successfully (i.e., CanTSyn_TxConfirmation returns E_OK in parameter result)

then the CanTSyn shall set the counter cyclicMsgResumeCounter to CanTSyn-CyclicMsgResumeTime for the corresponding Time Domain. | (RS_TS_20031)

[SWS_CanTSyn_00122] [If for a Time Domain cyclicMsgResumeCounter is greater than 0, then the CanTSyn shall discard cyclic Timesync message transmission requests for that Time Domain. $|(RS\ TS\ 20031)|$

[SWS_CanTSyn_00220] [If for a Time Domain cyclicMsgResumeCounter is greater than 0, then the CanTSyn shall decrement upon each invocation of CanTSyn_-MainFunction the cyclicMsgResumeCounter of the corresponding Time Domain by CanTSynMainFunctionPeriod.] (RS_TS_20031)

[SWS_CanTSyn_00121] [If the cyclicMsgResumeCounter is decremented to 0 or below, then the CanTSyn shall resume cyclic Timesync message transmission within the same CanTSyn_MainFunction call by requesting either a SYNC or OFS message transmission.] (RS_TS_20031)

Rationale: [SWS_CanTSyn_00121] is to ensure, that the first cyclic transmission is requested in the same main function call in which also cyclicMsgResumeCounter reaches 0 (refer to term "earliest possible" main function in [SWS_CanTSyn_00028] and [SWS_CanTSyn_00038]). If the message is actually really transmitted depends also on the debounceCounter.

7.4.6 Calculation and Assembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be calculated (1st step) and how the message will be assembled (2nd step).

7.4.6.1 Global Time Calculation

In addition to the message fields (refer to chapter 7.3)

- SyncTimeSec
- ovs and
- SyncTimeNSec,

which are actually transmitted on the bus by the Time Master, this chapter defines and uses the following internal variables for calculation of the Global Time to be transmitted on the bus for Synchronized Time Domains:

- T0_{SYNC}: Global Time retrieved from StbM
- T0_{SYNC ns}: Nanosecond part of T0_{SYNC}
- T0_{VLT}: Virtual Local Time that corresponds to T0_{SYNC}. Retrieved together with T0_{SYNC} from StbM
- T1_{VLT}: Egress timestamp of SYNC message relative to Virtual Local Time in StbM

- T1_{CAN}: Egress timestamp of SYNC message as captured by CAN controller HW
- T4: Correction value for T0_{SYNC}, which accounts for the delay between retrieving the time tuple [T0_{SYNC};T0_{VLT}] from StbM and actually transmitting the SYNC message on the bus.
- T_{currentTime_CAN}: Current local time as read from CAN controller HW when TX confirmation interrupt for SYNC message is processed in CanTSyn

Refer to Figure 1.1 and to sequence diagram Figure 9.2 for a better understanding of all steps of the Global Time Calculation sequence of the Time Master as specified in the requirements below.

[SWS_CanTSyn_00149]{DRAFT} [If for a Synchronized Time Domain a cyclic or immediate transmission of a SYNC message is requested, the Time Master shall

- 1. get current Synchronized Time Base's Time Tuple as [T0_{SYNC};T0_{VLT}] via StbM_- GetCurrentTime and
- 2. call CanIf_Transmit with the seconds portion of T0_{SYNC} written to Sync-TimeSec field of the message data.

](RS_TS_20035)

After a successful transmission of the SYNC message the CanTSyn captures the egress timestamp of the SYNC message.

[SWS_CanTSyn_00150]{DRAFT} [Upon successful SYNC message TX confirmation for a Synchronized Time Domain and if no TX confirmation timeout has occurred (refer to [SWS_CanTSyn_00033]) the Time Master shall within the TX confirmation routine (CanTSyn_TxConfirmation)

- if HW timestamping is enabled,
 - Retrieve T1_{CAN} as egress timestamp from CAN controller HW value via CanIf_GetEgressTimeStamp
- else
 - Retrieve T1_{VLT} as egress timestamp by reading current Virtual Local Time value via StbM_GetCurrentVirtualLocalTime

(RS TS 20035, RS TS 20070)

Note: If SW timestamping is used, SW should immediately establish a protection against interruptions in the TX confirmation callback - unless interrupt nesting is disabled (when this is typically done implicitly by the controller). Any delay of StbM_-GetCurrentVirtualLocalTime would impair precision.

Based on the egress timestamps $T1_{CAN}$ and $T1_{VLT}$, respectively, CanTSyn can calculate the delay between reading the tuple $[T0_{SYNC}; T0_{VLT}]$ from StbM via StbM_GetCurrentTime and actual transmission of $T0_{SYNC}$ in the SYNC message on the bus.

T4, which accounts for that delay, is calculated in 3 different ways depending on

- whether HW timestamping is enabled or not and
- whether the StbM is using for internal time measurement the same time source as the CanTSyn for Virtual Local Time

This can be done either in the TX confirmation routine (CanTSyn_TxConfirmation) or in the subsequent CanTSyn_MainFunction invocation.

```
 \hspace{-0.1cm} \textbf{[SWS\_CanTSyn\_00151]} \{ DRAFT \} \hspace{0.1cm} \lceil \hspace{0.1cm} \\ \hspace{0.1cm} \textbf{If} \hspace{0.1cm} \\ \hspace{0.1cm} \text{If} \hspace{0.1cm} \\ \hspace{0.1cm} \text{IIII} \hspace{0.1cm} \\ \hspace{0.1cm} \hspace{0.1cm} \hspace{0.1cm} \hspace{0.1cm} \hspace{0.1cm} \hspace{0.1cm} \hspace{0.1cm} \hspace{0.1
```

HW timestamping is disabled,

CanTSyn shall after successful capture of the egress timestamp (refer to [SWS_CanTSyn_00150]):

• calculate $T4 = T0_{SYNC \text{ ns}} + (T1_{VLT} - T0_{VLT})$

(RS_TS_20035)

```
 \hspace{-0.1cm} \textbf{[SWS\_CanTSyn\_00152]} \{ \hspace{-0.1cm} \textbf{DRAFT} \} \hspace{0.1cm} \lceil \hspace{0.1cm} \textbf{If} \hspace{0.1cm} \hspace{0.1cm} \hspace{0.1cm}
```

- HW timestamping is enabled and
- CanTSyn is using for internal time measurement the same time source as the StbM for Virtual Local Time,

CanTSyn shall after successful capture of the egress timestamp (refer to [SWS CanTSyn 00150])

 calculate T4 = T0_{SYNC_ns} + T1_{VLT} - T0_{VLT}, with T1_{VLT} = T1_{CAN}

```
(RS TS 20035, RS TS 20070)
```

Note: In case CanTSyn uses for internal time measurement the same time source as the StbM for Virtual Local Time T1_{CAN} equals T1_{VLT}.

```
[SWS_CanTSyn_00153]{DRAFT} |
```

- HW timestamping is enabled and
- CanTSyn is using for internal time measurement a different time source as the StbM for Virtual Local Time,

CanTSyn shall after successful capture of the egress timestamp (refer to [SWS_CanTSyn_00150]):

- 1. establish a protection against interruptions
- 2. read T_{currentTime CAN} via CanIf_GetCurrentTime,
- 3. read T1_{VLT} via StbM_GetCurrentVirtualLocalTime,

- 4. release the protection against interruptions and
- 5. calculate $T4 = T0_{SYNC \text{ ns}} + (T1_{VLT} T0_{VLT}) (T_{currentTime CAN} T1_{CAN})$

(RS_TS_20035, RS_TS_20070)

Note: In the above sequence protection against interruptions is important, because any interruption of the sequence of step 2 and step 3 would worsen the precision of T4 and hence the Global Time.

Note: The term $T_{currentTime_CAN}$ - $T1_{CAN}$ compensates the interrupt delay from egress timestamping in HW until $T1_{VLT}$ can be sampled in $CanTSyn_TxConfirmation$ via $StbM_GetCurrentVirtualLocalTime$.

[SWS_CanTSyn_00154]{DRAFT} [If for a Synchronized Time Domain a FUP message is due, the Time Master shall

- 1. call CanIf_Transmit and
- 2. write the following data to the message:
 - (a) seconds portion of T4 (T4 >= 1s) to the OVS field and
 - (b) nanoseconds portion of T4 to the SyncTimeNSec field

(RS TS 20035)

[SWS_CanTSyn_00046] [The transmitter of an Offset Time Base (Time Master) shall perform the following steps to distribute the Offset Time Base exactly:

- Retrieve current Offset Time via StbM_GetOffset
- Write seconds portion of the Offset Time to the OfsTimeSec field
- Write nanoseconds portion of the Offset Time to the OfsTimeNSec field

|(RS_TS_20036)

Note: OFS and OFNS messages are not time stamped.

7.4.6.2 OVS Calculation

[SWS_CanTSyn_00047] [OVS shall be set within FUP messages if the transmitter detects a nanosecond overflow greater than the defined range of StbM_TimeStamp-Type.nanoseconds (refer to [SWS_CanTSyn_00154]). The leftover part of seconds which does not fit into StbM_TimeStampType.nanoseconds shall be written to OVS.] (RS TS 20035)

7.4.6.3 SGW Calculation

[SWS_CanTSyn_00030] [The SGW value (Time Gateway synchronization status) shall be retrieved from the Time Base synchronization status. If the SYNC_TO_GATEWAY bit within timeBaseStatus is not set the SGW value shall be SyncToGTM. Otherwise the SGW value shall be set to SyncToSubDomain. | (RS_TS_20035, RS_TS_20036)

7.4.6.4 Sequence Counter Calculation

[SWS_CanTSyn_00048] [A Sequence Counter (SC) of 4 bit is representing numbers from 0 to 15 per Time Domain. The Sequence Counter shall be independent between SYNC and OFS messages and shall be incremented by 1 continuously on every transmission request of a SYNC or OFS message. It shall wrap around at 15 to 0 again.] (RS_TS_20033, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00049] [The Sequence Counter (SC) value for a FUP message shall be set to the SC value of the corresponding SYNC message. The SC value for an OFNS message shall be set to the SC value of the corresponding OFS message.] (RS_TS_20033, RS_TS_20035, RS_TS_20036)

7.4.6.5 CRC Calculation

[SWS_CanTSyn_00050] [The function <code>Crc_CalculateCRC8H2F</code> as defined in [6] shall be used to calculate the <code>CRC</code> if configured. $\lfloor (RS_TS_20033, RS_TS_20035, RS_TS_20036)$

[SWS_CanTSyn_00054] [The DataID shall be calculated as DataID = DataIDList [SC], where DataIDList is given by configuration for each message type (refer to configuration containers CanTSynGlobalTimeSyncDataIDList, CanTSynGlobalTimeFupDataIDList, CanTSynGlobalTimeOfsDataIDList and CanTSynGlobalTimeOfnsDataIDList). | (RS_TS_20033, RS_TS_20035, RS_TS_20036)

Note: A specific DataID out of a predefined DataIDList ensures the identification of data elements of Time Synchronization messages.

[SWS_CanTSyn_00055] [If CanTSynUseExtendedMsgFormat is FALSE, the CRC shall be calculated over Time Synchronization message byte 2 to byte 7 and DataID, where byte 2 is applied first, followed by the other bytes in ascending order, and Data ID last.

If CanTSynUseExtendedMsgFormat is TRUE, the CRC shall be calculated over Time Synchronization message byte 2 to byte 15 and DataID for Extended Timesync message formats, where byte 2 is applied first, followed by the other bytes in ascending order, and DataID last.

(RS TS 20033, RS TS 20035, RS TS 20036, RS TS 20068)

7.4.6.6 ICV Generation

[SWS_CanTSyn_00161]{DRAFT} [The ICV shall be calculated over SYNC payload, FUP payload and FV (based on configuration CanTSynIcvGenerationFvIdRef) and is included in the FUP message. | (RS_TS_20073)

[SWS_CanTSyn_00162]{DRAFT} [The ICV shall be calculated over Extended OFS payload and FV (based on configuration CanTSynIcvGenerationFvIdRef) and is included in the Extended OFS message. | (RS TS 20073)

Refer to the chapter 7.3.13 in StbM [5] for the configuration details of \mathbb{F}^{\vee} referenced in each Time Domain.

[SWS_CanTSyn_00163]{DRAFT} [When the FV is referenced (refer CanTSynIcv-GenerationFvIdRef) and the configured truncated FV length (StbMFreshness-ValueTruncLength) == FV length (StbMFreshnessValueLength) in StbM, the Time Master shall call the StbM_GetTxFreshness Api to obtain the FV by using the StbMFreshnessValueId. |(RS TS 20073)|

[SWS_CanTSyn_00164]{DRAFT} [When the FV is referenced (refer CanTSynIcv-GenerationFvIdRef) and the configured truncated FV length (StbMFreshness-ValueTruncLength) < FV length (StbMFreshnessValueLength), the Time Master shall call the StbM_GetTxFreshnessTruncData Api to obtain the FV and the truncated FV by using the StbMFreshnessValueId.|(RS TS 20073)

[SWS_CanTSyn_00165]{DRAFT} [When the FV is not referenced (refer CanTSyn-IcvGenerationFvIdRef), the Time Master shall not include the FV in the ICV generation and fill 0 for FVL field in message types 0×78 , 0×88 , 0×94 , 0×84 .] (RS_-TS_20073)

[SWS_CanTSyn_00166]{DRAFT} [If StbM_GetTxFreshness returns E_OK, the Time Master shall construct the message types 0x78, 0x88, 0x94, 0xA4 with the full FV, set the FVL to StbMFreshnessValueLength and use the full FV in ICV generation.] (RS_TS_20073)

[SWS_CanTSyn_00167]{DRAFT} [If StbM_GetTxFreshnessTruncData returns E_OK, the Time Master shall construct the message types 0x78, 0x88, 0x94, 0xA4 with truncated FV, set the FVL to StbMFreshnessValueTruncLength and use the full FV in ICV generation.] (RS_TS_20073)

[SWS_CanTSyn_00168]{DRAFT} [If StbM_GetTxFreshness or StbM_GetTxFreshnessTruncData return a non-recoverable error code (i.e, E_NOT_OK), the Time Master shall:

- stop the ICV generation and accordingly fill 0 for FVL and ICVL fields in message types 0x78, 0x88, 0x94 and 0xA4,
- call Det_ReportRuntimeError with the parameter Errorld set to CANTSYN_ E FRESHNESSFAILURE (refer [SWS CanTSyn 91001]),

call IdsM_SetSecurityEventWithContextData with the parameter EventId set to SEV_TSYN_CAN_FRESHNESS_NOT_AVAILABLE (refer [SWS_CanTSyn_00204])

(RS TS 20073)

Refer to the chapter 10.2.5 in [7] for the configuration details of CSM job used for ICV generation.

[SWS_CanTSyn_00169]{DRAFT} [If CanTSynIcvGenerationBase for the Time Domain is configured to ICV_MAC, the Time Master shall call Csm_MacGenerate to generate the ICV value. | (RS_TS_20073)

[SWS_CanTSyn_00170]{DRAFT} [If CanTSynIcvGenerationBase for the Time Domain is configured to ICV_SIGNATURE, the Time Master shall call Csm_SignatureGenerate to generate the ICV value.|(RS TS 20073)

Note: The mode parameter is intentionally left open for the implementer to choose (i.e. CRYPTO_OPERATIONMODE_SINGLECALL would possibly be the best option since it does not require further calls to CSM).

The CSM job used to generate the ICV can be configured to synchronous or asynchronous behaviour.

[SWS_CanTSyn_00171]{DRAFT} [If the CSM job used to generate ICV is configured in synchronous behaviour, the Time Master shall disable ICV generation timeout monitoring. $|(RS\ TS\ 20073)|$

[SWS_CanTSyn_00172]{DRAFT} [If the CanTSynIcvGenerationTimeout is set to 0, the Time Master shall not do the ICV generation timeout monitoring.] (RS_TS_-20073)

[SWS_CanTSyn_00173]{DRAFT} [If CanTSynIcvGenerationTimeout is set to any value > 0 and Csm_MacGenerate or Csm_SignatureGenerate returns E_OK, the Time Master shall start the CanTSynIcvGenerationTimeout.] (RS_TS_20073)

[SWS_CanTSyn_00174]{DRAFT} [If CanTSynIcvGenerationTimeout is set to any value > 0 and the CanTSyn_IcvGenerationIndication callback is called, the Time Master shall stop the running CanTSynIcvGenerationTimeout.] (RS_TS_-20073)

[SWS_CanTSyn_00175]{DRAFT} [If one of the following conditions is true:

- the authentication build counter has reached the configuration value CanTSyn-TxAuthenticationBuildAttempts,
- the verification of the ICV has returned a non-recoverable error such as returning E_NOT_OK or KEY_FAILURE,
- or CantSynIcvGenerationTimeout expires before the notification of the CantSyn_IcvGenerationIndication callback,

then the Time Master shall

- stop the ICV generation and accordingly fill 0 for ICVL field in message types 0x78, 0x88, 0x94 and 0xA4,
- and call IdsM_SetSecurityEventWithContextData with the parameters EventId set to SEV_TSYN_CAN_ICV_GENERATION_FAILED (refer [SWS_CanTSyn_00204])

(RS TS 20073)

[SWS_CanTSyn_00176]{DRAFT} [With the notification of the CanTSyn_IcvGenerationIndication callback and successful generation of ICV, the Time Master shall add the generated ICV to the ICV field in message types 0x78, 0x88, 0x94 and 0xA4 and transmit the FUP, Extended OFS message.|(RS TS 20073)

[SWS_CanTSyn_00177]{DRAFT} [If the FV is referenced (refer CanTSynIcvGenerationFvIdRef), then the Time Master shall notify the successful transmission of messages of type 0x78, 0x88, 0x94 and 0xA4 to FVM by calling StbM_SPduTx-Confirmation.|(RS TS 20073)

[SWS_CanTSyn_00210]{DRAFT} [For every transmission of messages of type 0×78 , 0×88 , 0×94 and $0 \times A4$ the Time Master shall maintain an authentication build counter (refer CanTSynTxAuthenticationBuildAttempts).|(RS_TS_20073)

[SWS_CanTSyn_00211]{DRAFT} [Upon the initial processing of messages of type 0x78, 0x88, 0x94 and 0xA4 the Time Master shall set the authentication build counter to $0.|(RS\ TS\ 20073)$

[SWS_CanTSyn_00212]{DRAFT} [When StbM_GetTxFreshness or StbM_GetTxFreshnessTruncData return a recoverable error code (e.g., STBM_E_BUSY), then the Time Master shall increment the authentication build counter.] (RS_TS_20073)

[SWS_CanTSyn_00213]{DRAFT} [When Csm_MacGenerate or Csm_Signature-Generate return a recoverable error code (e.g., E_BUSY, QUEUE_FULL), then the Time Master shall increment the authentication build counter. | (RS TS 20073)

[SWS CanTSyn 00214]{DRAFT} [If

- building the authenticated message has failed
- and the authentication build counter has not yet reached the configuration value CanTSynTxAuthenticationBuildAttempts,

then the Time Master shall retry the freshness attempt and ICV calculation in the next call of CantSyn_MainFunction.] (RS_TS_20073)

7.4.6.7 Message Assembling

[SWS_CanTSyn_00056] [For each transmission of a Time Synchronization message the CanTSyn module shall assemble the message as follows:

1. Calculate OVS (FUP only)

- 2. Calculate SGW (FUP, OFNS and Extended OFS)
- 3. Calculate SC
- 4. Copy all data to the appropriate position within the related message
- 5. Calculate CRC (configuration dependent)
- 6. Fetch FV (configuration dependent) and append FVL, ICVL and FV in the appropriate position within the related message
- 7. Calculate ICV (configuration dependent) and append in the appropriate position within the related message

(RS TS 20033, RS TS 20035, RS TS 20036, RS TS 20073)

7.5 Acting as Time Slave

A Time Slave is an entity, which is the recipient for a certain Time Base within a certain segment of a communication network, being a consumer for this Time Base.

7.5.1 SYNC and FUP message processing

[SWS_CanTSyn_00057] [The CanTSyn shall only accept a SYNC message with Type equal to 0x20 and a correct CRC value if CanTSynRxCrcValidated is configured to CRC_VALIDATED.|(RS TS 20034, RS TS 20035)

[SWS_CanTSyn_00058] [The CanTSyn shall only accept a SYNC message with Type equal to 0x10 if CanTSynRxCrcValidated is configured to CRC_NOT_VALIDATED.|(RS_TS_20035)

[SWS_CanTSyn_00059] [The CanTSyn shall only accept a SYNC message with Type equal to 0x10 or 0x20 if CanTSynRxCrcValidated is configured to CRC_-IGNORED.|(RS_TS_20035)

[SWS_CanTSyn_00109] [The CanTSyn shall only accept a SYNC message with Type equal to 0x10 or a SYNC message with Type equal to 0x20 and a correct CRC value if CanTSynRxCrcValidated is configured to CRC_OPTIONAL. | (RS TS 20034, RS TS 20035)

[SWS_CanTSyn_00178]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV_VERIFIED, the CanTSyn shall perform ICV verification for FUP messages with ICV (Message type: 0x78, 0x88).

The CanTSyn shall consider ICV verification as failed for FUP messages without ICV (Message type: 0×18 , 0×28). $|(RS_TS_20073)|$

[SWS_CanTSyn_00179]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV_NOT_VERIFIED, the CanTSyn shall not perform the ICV verification and the FUP messages shall not contain an ICV value (Message type: 0x18, 0x28).

The CanTSyn shall consider ICV verification as failed for FUP messages with ICV (Message Type: 0×78 , 0×88). | (RS TS 20073)

[SWS_CanTSyn_00180] {DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV_IGNORED, the CanTSyn shall not perform the ICV verification.

The CanTSyn shall ignore the ICV in FUP messages with ICV (Message type: 0x78, 0x88). | (RS TS 20073)

[SWS_CanTSyn_00181]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV_OPTIONAL, the CanTSyn shall perform ICV verification for FUP messages with ICV (Message type: 0x78, 0x88).

The CanTSyn shall not perform ICV verification for FUP messages without ICV (Message type: 0×18 , 0×28). | (RS TS 20073)

[SWS_CanTSyn_00060] [If CanTSynRxCrcValidated is configured to CRC_VALIDATED, the CanTSyn shall only accept a FUP message

- with a Sequence Counter identical to the value of the corresponding SYNC message
- and Type equal to 0x28 or 0x88
- and a correct CRC value.

(RS TS 20034, RS TS 20035)

[SWS_CanTSyn_00061] [If CanTSynRxCrcValidated is configured to CRC_NOT_-VALIDATED, the CanTSyn shall only accept a FUP message

- with a Sequence Counter identical to the value of the corresponding SYNC message
- and Type equal to 0x18 or 0x78.

(RS TS 20034, RS TS 20035)

[SWS_CanTSyn_00062] [If CanTSynRxCrcValidated is configured to CRC_IGNORED, the CanTSyn shall only accept a FUP message

- with a Sequence Counter identical to the value of the corresponding SYNC message
- and Type equal to 0x18, 0x28, 0x78 and 0x88.

|(RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00110] [If CanTSynRxCrcValidated is configured to CRC_OPTIONAL, the CanTSyn shall only accept

- a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and Type equal to 0x18 or 0x78
- or a FUP message with an identical sequence counter to the value of the corresponding SYNC message and Type equal to 0x28 or 0x88 and a correct CRC value.

(RS TS 20034, RS TS 20035)

[SWS_CanTSyn_00063] [For each configured Time Slave (refer to CanTSynGlobalTimeSlave) the CanTSyn module shall observe the reception timeout CanTSynGlobalTimeFollowUpTimeout between the SYNC and its FUP message.

If the reception timeout occurs the sequence shall be reset (i.e., waiting for a new SYNC message). | (RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00182]{DRAFT} [If the SYNC message is received while the CanTSynGlobalTimeFollowUpTimeout is running, the Time Slave shall discard the received SYNC message, reset the sequence (i.e. waiting for a new SYNC) and raise the security event SEV_TSYN_CAN_MSG_SEQUENCE_ERROR (refer [SWS_CanTSyn_00204]).|(RS_TS_20073)

Note: The general timeout monitoring for the Time Base update is located in the StbM and not in the Timesync modules.

[SWS_CanTSyn_00064] [For a valid pair of SYNC and FUP messages with successfully validated set of values <code>SyncTimeSec</code>, <code>OVS</code> and <code>SyncTimeNSec</code> a new Rx Time Tuple [TG_{Rx};T2_{VLT}] (refer to [5]), consisting of the Global Time value and the associated value of the Virtual Local Time, shall be calculated (refer to [SWS_CanTSyn_00146], [SWS_CanTSyn_00147], [SWS_CanTSyn_00148]) and forwarded to the <code>StbM</code> module <code>via StbM_BusSetGlobalTime.</code> | (RS_TS_20032, RS_TS_20034)

[SWS_CanTSyn_00183]{DRAFT} [When for a Time Domain any SYNC or FUP message is received within CantSynGlobalTimeRxDebounceTime after the previous Timesync message of that Time Domain, then the Time Slave shall discard the received message and reset the sequence (i.e. waiting for a new SYNC).](RS_TS_-20073)

[SWS CanTSyn 00207]{DRAFT} [If

- for a Time Domain Security Event reporting is enabled (CantSynEnableSecurityEventReporting is true)
- and any SYNC or FUP message is received within CanTSynGlobalTimeRxDebounceTime after the previous Timesync message of that Time Domain,

then the Time Slave shall raise the security event SEV_TSYN_CAN_MSG_SEQUENCE_-ERROR, i.e., call IdsM_SetSecurityEventWithContextData with parameter securityEventId set to SEV_TSYN_CAN_MSG_SEQUENCE_ERROR.|(RS TS 20073)

Rationale: Intention of [SWS_CanTSyn_00182] and [SWS_CanTSyn_00183] is to improve robustness of the CanTSyn module against message sequence errors, specifi-

cally injection of fake SYNC messages by an attacker. Note that this will not allow to filter out all possible fake SYNC scenarios.

7.5.2 OFS and OFNS message processing

7.5.2.1 CRC Validation of OFS messages

[SWS_CanTSyn_00065] [If CanTSynRxCrcValidated is configured to CRC_VALIDATED, the CanTSyn shall only accept an OFS message

- with Type equal to 0x44, 0x64 or 0xA4
- and a correct CRC value.

(RS TS 20034, RS TS 20036)

[SWS_CanTSyn_00066] [If CanTSynRxCrcValidated is configured to CRC_NOT_-VALIDATED, the CanTSyn shall only accept an OFS message with Type equal to 0x34, 0x54 or 0x94.] (RS TS 20036)

[SWS_CanTSyn_00067] [If CanTSynRxCrcValidated is configured to CRC_IGNORED, the CanTSyn shall only accept an OFS message with Type equal to 0x34, 0x44, 0x54, 0x64, 0x94 or 0xA4.] (RS_TS_20036)

[SWS_CanTSyn_00113] [If CanTSynRxCrcValidated is configured to CRC_OPTIONAL, the CanTSyn shall only accept

- an OFS message with Type equal to 0x34, 0x54 or 0x94
- or an OFS message with Type equal to 0x44, 0x64 or 0xA4 and a correct CRC value.

(RS TS 20034, RS TS 20036)

7.5.2.2 CRC Validation of OFNS messages

Table 7.19 lists those combinations of the values for

- the parameter CanTSynRxCrcValidated,
- the message type byte
- and CRC correctness,

which result in a successful CRC validation of an OFNS messages by the CanTSyn. The CRC validation will fail for other combinations of the listed parameters/variables.

Value of Parameter	Message	Message	Message has	Related
CanTSynRxCrcValidated	Type	contains CRC	correct CRC	Requirement
CRC_NOT_VALIDATED	0x3C		n/a	[SWS_CanTSyn_00069]
CRC_VALIDATED	0x4C	X	yes	[SWS_CanTSyn_00068]

CRC_OPTIONAL	0x3C		n/a	[SWS_CanTSyn_00114]
CRC_OPTIONAL	0x4C	Х	yes	[SWS_CanTSyn_00114]
CRC_IGNORED	0x3C		n/a	[SWS_CanTSyn_00070]
CRC_IGNORED	0x4C	Х	don't care	[SWS_CanTSyn_00070]

Table 7.19: Settings of CanTSynRxCrcValidated for OFNS messages

[SWS_CanTSyn_00068] [If CanTSynRxCrcValidated is configured to CRC_VALIDATED, then the CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x4C and a correct CRC value.] (RS_TS_20034, RS_TS_20036)

[SWS_CanTSyn_00069] [If CanTSynRxCrcValidated is configured to CRC_NOT_-VALIDATED, then the CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x3C.|(RS_TS_20036)

[SWS_CanTSyn_00070] [If CanTSynRxCrcValidated is configured to CRC_IGNORED, then the CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to $0 \times 3 \text{C}$ or $0 \times 4 \text{C.}$] (RS_TS_20036)

[SWS_CanTSyn_00114] [If CanTSynRxCrcValidated is configured to CRC_OP-TIONAL, then the CanTSyn shall only accept

- an OFNS message with a Sequence Counter identical to the value of the corresponding OFS message and Type equal to 0x3C
- ullet or an OFNS message with a identical Sequence Counter identical to the value of the corresponding OFS message and Type equal to $0\times4C$ and a correct CRC value.

(RS TS 20034, RS TS 20036)

7.5.2.3 ICV Verification of Extended OFS Messages

[SWS_CanTSyn_00184]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV_VERIFIED, the CanTSyn shall perform ICV verification for Extended OFS messages with ICV messages (Message type: 0x94, 0xA4).

The CanTSyn shall consider ICV verification as failed for Extended OFS messages without ICV (Message type: 0×54 , 0×64).] (RS_TS_20073)

[SWS_CanTSyn_00185]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV_NOT_VERIFIED, the CanTSyn shall not perform the ICV verification and the Extended OFS messages shall not contain an ICV value (Message type: 0x54, 0x64).

The CanTSyn shall consider ICV verification as failed for Extended OFS messages with ICV (Type: 0x94, 0xA4). | (RS_TS_20073)

[SWS_CanTSyn_00186]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV_IGNORED, the CanTSyn shall not perform the ICV verification.

The CanTSyn shall ignore the ICV in Extended OFS messages with ICV (Message type: 0x94, 0xA4).|(RS_TS_20073)

[SWS_CanTSyn_00187]{DRAFT} [If CanTSynRxIcvVerificationType is configured to ICV_OPTIONAL, the CanTSyn shall perform ICV verification for Extended OFS messages with ICV (Message type: 0x94, 0xA4).

The CanTSyn shall not perform ICV verification for Extended OFS messages without ICV (Message type: 0×54 , 0×64). | (RS_TS_20073)

7.5.2.4 **General**

[SWS_CanTSyn_00071] [If CanTSynUseExtendedMsgFormat is FALSE, the CanTSyn shall observe for each configured Time Slave (CanTSynGlobal-TimeSlave) the reception timeout CanTSynGlobalTimeFollowUpTimeout between the OFS and its OFNS message.

If the reception timeout occurs the sequence shall be reset (i.e. waiting for a new OFS message). | (RS_TS_20034, RS_TS_20036, RS_TS_20068)

Note: The general timeout monitoring for the Time Base update is located in the StbM and not in the Timesync modules.

[SWS_CanTSyn_00072] [For a valid pair of OFS and OFNS messages and if CanTSynUseExtendedMsgFormat is FALSE, the CanTSyn shall calculate a new Time Tuple, consisting of the Offset Time value and the associated value of the Virtual Local Time, (according to [SWS_CanTSyn_00074]) and forward it to the StbM module via StbM_BusSetGlobalTime.

If CanTSynUseExtendedMsgFormat is TRUE, the CanTSyn shall calculate a new Time Tuple, consisting of the Offset Time value and the associated value of the Virtual Local Time, (according to [SWS_CanTSyn_00074]) after receiving a valid Extended OFS message and forward it to the StbM module via StbM_BusSetGlobalTime. | (RS TS 20032, RS TS 20034, RS TS 20068)

[SWS_CanTSyn_00208]{DRAFT} [During CanTSynGlobalTimeRxDebounceTime, when any OFS or OFNS message is received, then the Time Slave shall discard the received message and reset the sequence (i.e. waiting for a new OFS message).] (RS TS 20073)

 $\begin{tabular}{l} [SWS_CanTSyn_00209] {\it DRAFT} & [During CanTSynGlobalTimeRxDebounceTime, if the context of the context o$

any OFS or OFNS message is received

• and Security Event reporting is enabled (CanTSynEnableSecurityEventReporting is true)

then the Time Slave shall raise the security event SEV_TSYN_CAN_MSG_SEQUENCE_-ERROR.|(RS TS 20073)

[SWS_CanTSyn_00116] [On an invocation of StbM_BusSetGlobalTime the parameter pathDelay of the measureDataPtr structure shall be set to $0.](RS_TS_-20034)$

7.5.3 Validation and Disassembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be validated (1st step) and how the message will be disassembled (2nd step).

7.5.3.1 Global Time Calculation

In addition to the message fields (refer to chapter section 7.3)

- SyncTimeSec
- ovs and
- SyncTimeNSec,

which are actually received by the Time Slave on the bus from the Time Master, this chapter defines and uses the following internal variables for calculation of the Rx Time Tuple for Synchronized Time Domains:

- T0: Global Time (seconds portion) received from Time Master in SYNC message.
- T1_{VLT}: Ingress timestamp of SYNC message as captured by HW in the CAN controller or by SW in CanTSyn_RxIndication.
- TG_{Rx}: Global Time component of the Rx Time Tuple.
- T2_{VLT}: Virtual Local Time component of the Rx Time Tuple (equivalent to TV_Rx in the StbM).
- T3_{VLT}: Current time read out from CAN controller hardware used for correlation of StbM time and CAN HW clock.
- T5_{VLT}: Current virtual local time in StbM used for correlation of StbM local time and CAN HW clock.
- T4: Correction value for T0 as received from the Time Master. It is calculated from values of OVS and SyncTimeNSec field in the FUP message.
- T_{SRD}: SYNC reception delay as difference between T3_{VLT} and T1_{VLT}.

Refer to Figure 1.1 and to the sequence diagram in Figure 9.4 as well as to the flow chart in Figure 7.3 for a better understanding of all steps of the Global Time calculation sequence of the Time Slave as specified in the requirements below.

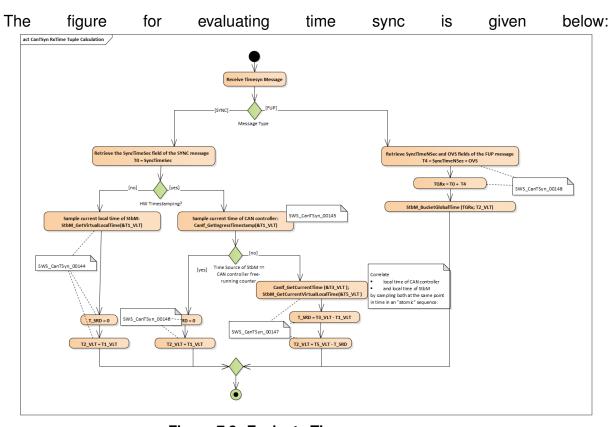

Figure 7.3: Evaluate Timesync message

[SWS_CanTSyn_00144]{DRAFT} [For a Time Slave, on invocation of CanTSyn_-RxIndication for a SYNC message, and if CanTSynHardwareTimestampSupport is set to FALSE, CanTSyn shall

- 1. immediately establish a protection against interruption
- 2. and directly afterwards retrieve the reference time T1_{VLT} for the SYNC message via StbM GetCurrentVirtualLocalTime from the StbM

Note: Once T1_{VLT} has been retrieved, protection against interruptions may be released

- 3. set the $T2_{VLT}$ part of the Rx Time Tuple to the value of $T1_{VLT}$ (i.e., $T2_{VLT} = T1_{VLT}$)
- 4. set the SYNC reception delay T_{SRD} to 0
- 5. retrieve T0 from the SyncTimeSec field of the SYNC message

(RS_TS_20035, RS_TS_20070)

Note: Immediate protection against interruptions means that there shall be no frame checks before (if called in context of the RX interrupt with interrupt nesting disabled, interrupt protection is typically implicitly ensured by the controller). Once the interrupts are locked, it is ok to check whether the received message is a SYNC message for which a snapshot of the Virtual Local Time shall be taken, but no other frame checks (e.g., CRC validation, SC validation, etc.) shall be done before taking $T1_{VLT}$. Once $T1_{VLT}$ has been sampled it is ok to remove the protection against interruptions and to make the necessary validations. This means that $T1_{VLT}$ will be taken even if the succeeding validations fail and thus making the snapshot superfluous.

[SWS_CanTSyn_00145]{DRAFT} [For a Time Slave, on invocation of CanTSyn_-RxIndication for a SYNC message, and if CanTSynHardwareTimestampSupport is set to TRUE, CanTSyn shall

- \bullet retrieve T1_{VLT} from the ingress timestamp of the SYNC message via <code>CanIf_-GetIngressTimeStamp</code>
- convert T1_{VLT} to a representation in ns
- retrieve T0 from the SyncTimeSec field of the SYNC message

(RS_TS_20035)

[SWS_CanTSyn_00146]{DRAFT} [For a Time Slave, on invocation of $CanTSyn_-RxIndication$ for a SYNC message

- and if CantSynHardwareTimestampSupport is set to TRUE
- and if the StbM uses the CAN controller hardware counter as Virtual Local Time source for the Time Base (refer to StbMLocalTimeClock),

CanTSyn shall

- set $T2_{VLT}$ part of the Rx Time Tuple to the value of $T1_{VLT}$ (i.e., $T2_{VLT} = T1_{VLT}$)
- and set the SYNC reception delay T_{SRD} to 0.

(RS TS 20035)

[SWS_CanTSyn_00147]{DRAFT} [For a Time Slave, on invocation of CanTSyn_-RxIndication for a SYNC message,

- and if CantSynHardwareTimestampSupport is set to TRUE
- and if the StbM does not use the CAN controller hardware counter as Virtual Local Time source for the Time Base (refer to StbMLocalTimeClock)

CanTSyn shall correlate the CAN HW time and the Virtual Local Time of the StbM by applying the following sequence:

- 1. protect the following two steps against interruptions
- 2. retrieve the current time of the CAN controller hardware counter via CanIf_-GetCurrentTime and convert it to the Virtual Local Time T3_{VLT},

- 3. retrieve the current value of the Virtual Local Time of the corresponding Time Base in the StbM via StbM_GetCurrentVirtualLocalTime as T5_{VLT},
- 4. calculate the SYNC reception delay T_{SRD} as (T3_{VLT} T1_{VLT})
- 5. T2_{VLT} shall be calculated as T5_{VLT} TSRD

(RS_TS_20035, RS_TS_20070)

Note: In the above sequence protection against interruptions is important, because any interruption of the sequence of step 2 and step 3 would worsen the precision of the local instance of the Global Time.

[SWS_CanTSyn_00148]{DRAFT} [For a Time Slave, on invocation of CanTSyn_-RxIndication for a FUP message, CanTSyn shall

- 1. retrieve the following data from the FUP message
 - the OVS field
 - and the SyncTimeSec field
- 2. and calculate T4 = OVS + SyncTimeSec

Either in the same Rx indication routine (CanTSyn_RxIndication) or in the subsequent CanTSyn_MainFunction invocation CanTSyn shall

- 1. calculate TG_{Rx} as (T0 + T4).
- 2. and forward the new Rx Time Tuple [TG $_{Rx}$; T2 $_{VLT}$] to the StbM via StbM_Bus-SetGlobalTime

(RS_TS_20035)

Note: In the above sequence protection against interruptions is important, because any interruption of the sequence of step 2 and step 3 would worsen the precision of local instance of the Global Time, which depends on time tuple $[TG_{Bx};T2_{VIT}]$.

[SWS_CanTSyn_00074] [The receiver of an Offset Time Base shall perform the following steps to assemble the Offset Time:

- 1. Get seconds portion of the Offset Time out of OfsTimeSec
- 2. Get nanoseconds portion of the Offset Time out of OfsTimeNSec
- 3. Retrieve current Virtual Local Time value via StbM_GetCurrentVirtualLo-calTime

(RS TS 20036)

Note: OFS and OFNS messages are not time stamped.

7.5.3.2 OVS Consideration

[SWS_CanTSyn_00075] [OVS (FUP only) shall be considered on the receiver side to retrieve the second portion of the received Synchronized Time Base. | (RS TS 20035)

7.5.3.3 SGW Calculation

[SWS_CanTSyn_00133] [If the SGW value (FUP, OFNS and Extended OFS) is set to SyncToSubDomain, the SYNC_TO_GATEWAY bit within timeBaseStatus shall be set to TRUE. Otherwise, it shall be set to FALSE. | (RS_TS_20032, RS_TS_20034)

7.5.3.4 Sequence Counter Validation

Figure 7.4 illustrates the Sequence Counter validation of a Time Slave for SYNC and OFS messages.

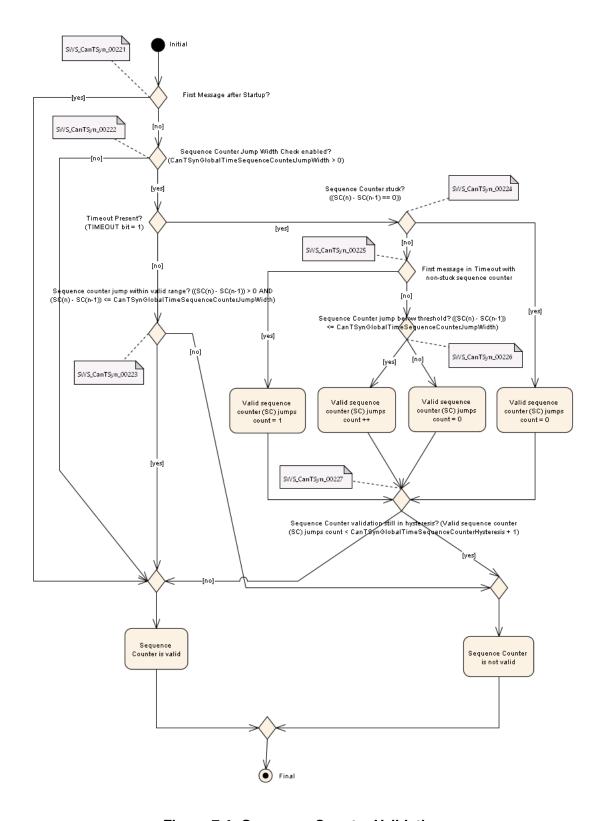

Figure 7.4: Sequence Counter Validation

[SWS_CanTSyn_00076] The Sequence Counter of each SYNC message must match to the Sequence Counter of the next incoming FUP message of the same Time Domain. Otherwise, the contents of the already received SYNC message shall be

discarded and the received FUP message shall be ignored. [(RS_TS_20034, RS_TS_-20035)

[SWS_CanTSyn_00077] [If CanTSynUseExtendedMsgFormat is FALSE, the Sequence Counter of each OFS message must match to the Sequence Counter of the next incoming OFNS message of the same Time Domain. If the SCs do not match, the received OFNS message shall be ignored and the contents of the already received OFS message shall be discarded. | (RS_TS_20034, RS_TS_20036, RS_TS_20068)

[SWS_CanTSyn_00078]{OBSOLETE} [The Sequence Counter Jump Width between two consecutive SYNC or two consecutive OFS messages of the same Time Domain shall be greater than 0 and smaller than or equal to CanTSynGlobalTimeSequence—CounterJumpWidth. Otherwise, a Time Slave shall ignore the respective SYNC / OFS message.

If the CantSynGlobalTimeSequenceCounterJumpWidth value is set to 0, the Time Slave shall not do Sequence Counter Jump Width checks. $\[(RS_TS_20034, RS_TS_20035, RS_TS_20036) \]$

[SWS_CanTSyn_00079]{OBSOLETE} [Upon reception of a SYNC (or OFS) message a Time Slave shall check the Sequence Counter of the received message per Time Domain against the configured value of CanTSynGlobalTimeSequenceCounter-JumpWidth (according to [SWS_CanTSyn_00078]), unless it is the first message

- at Startup or
- after a Time Base update timeout has been detected (TIMEOUT bit set in Time Base synchronization status timeBaseStatus).

(RS TS 20034, RS TS 20035, RS TS 20036)

[SWS_CanTSyn_00143]{OBSOLETE} [While a Time Base Timeout is present (TIME-OUT bit is set in Time Base synchronization status timeBaseStatus), CanTSyn shall discard SYNC/FUP (or OFS/OFNS) messages until it has successfully validated (refer to [SWS_CanTSyn_00078]) n consecutive SYNC/FUP (or OFS/OFNS) message pairs (n is given by the parameter CanTSynGlobalTimeSequenceCounterHysteresis).](RS_TS_20034)

[SWS_CanTSyn_00221]{DRAFT} [Upon reception of a SYNC (or OFS) message, if the message is the first SYNC (or OFS) message after startup, then a Time Slave shall consider the Sequence Counter value of the SYNC (or OFS) message as valid.] (RS TS 20033, RS TS 20034)

Rationale: After startup it makes sense to skip the Sequence Counter check and allow the Sequence Counter of the Time Slave to synchronize to the one of the Time Master.

[SWS_CanTSyn_00222]{DRAFT} [Upon reception of a SYNC (or OFS) message, if the Sequence Counter check is disabled for SYNC (or OFS) messages (i.e., CanTSyn-GlobalTimeSequenceCounterJumpWidth == 0), then a Time Slave shall consider the Sequence Counter value of the SYNC (or OFS) message as valid.] (RS_TS_-20033, RS_TS_20034)

[SWS_CanTSyn_00223]{DRAFT} [Upon reception of a SYNC (or OFS) message, if

- the message is not the first SYNC (or OFS) message after startup
- and Sequence Counter check is enabled (i.e., CanTSynGlobalTimeSequenceCounterJumpWidth > 0)
- and the Time Domain is not in timeout (i.e., TIMEOUT bit not set in Time Base synchronization status timeBaseStatus),

then a Time Slave shall check the difference value between the Sequence Counter of the current message and the Sequence Counter of the previous SYNC (or respectively OFS) message.

If the difference value is greater than 0 and less or equal than CanTSynGlobalTime—SequenceCounterJumpWidth, then a Time Slave shall consider the Sequence Counter value as valid, else as invalid. | (RS_TS_20033, RS_TS_20034)

7.5.3.4.1 Sequence Counter Hysteresis

This chapter specifies how to apply an optional hysteresis (CanTSynGlobalTime-SequenceCounterHysteresis, refer to [SWS_CanTSyn_00227]) to check if the Sequence Counter value is valid, i.e., if the Sequence Counter check is actually successful.

This requires that a number of consecutive Sequence Counter jumps are valid. Requirements [SWS_CanTSyn_00224], [SWS_CanTSyn_00225] and [SWS_CanTSyn_00226] specify when an individual Sequence Counter jump is considered to be valid.

The hysteresis improves robustness against a scenario with a buggy master implementation or injection of invalid master messages, i.e., when the Sequence Counter increments by more than CantSynGlobalTimeSequenceCounterJumpWidth. In such a scenario (without any hysteresis) a message with any (also invalid) Sequence Counter value would cause the Time Slave to leave the Timeout state although the Sequence Counter is not incremented correctly. A hysteresis avoids this.

[SWS_CanTSyn_00224]{DRAFT} [Upon reception of a SYNC (or OFS) message, if

- Sequence Counter check is enabled (i.e., CanTSynGlobalTimeSequence-CounterJumpWidth > 0)
- and the Time Domain is in timeout (i.e., TIMEOUT bit set in Time Base synchronization status timeBaseStatus)
- and the Sequence Counter is stuck, i.e., the value of the difference between the Sequence Counter of the current message and the Sequence Counter of the previous SYNC (or respectively OFS) message is 0,

then a Time Slave shall consider Sequence Counter jump as invalid. | (RS_TS_-20033, RS_TS_20034)

[SWS_CanTSyn_00225]{DRAFT} [Upon reception of a SYNC (or OFS) message, if

- Sequence Counter check is enabled (i.e., CanTSynGlobalTimeSequence-CounterJumpWidth > 0)
- and the Time Domain is in timeout (i.e., TIMEOUT bit set in Time Base synchronization status timeBaseStatus)
- and the message is the first SYNC (or OFS) message in Timeout for which the Sequence Counter is not stuck,

a Time Slave shall consider the Sequence Counter jump as valid.](RS_TS_20033, RS_TS_20034)

Rationale: After a Timeout (e.g., due to a reset or disconnect of the Time Master) it is very likely that the Sequence Counter of the first received Timesync message is out of sync, i.e., the Sequence Counter difference exceeds CantSynGlobalTimeSequenceCounterJumpWidth. To allow for faster re-synchronization of the Sequence Counter to the Time Master, the Sequence Counter of the first Timesync message is not checked for CantSynGlobalTimeSequenceCounterJumpWidth. However, a stuck Sequence Counter will always, i.e., also in this situation, be considered as invalid (refer to [SWS_CanTSyn_00224]).

[SWS_CanTSyn_00226]{DRAFT} [Upon reception of a SYNC (or OFS) message, if

- Sequence Counter check is enabled (i.e., CanTSynGlobalTimeSequence-CounterJumpWidth > 0)
- and the Time Domain is in timeout (i.e., TIMEOUT bit set in Time Base synchronization status timeBaseStatus)
- and the Sequence Counter is not stuck, i.e., the value of the difference between the Sequence Counter of the current message and the Sequence Counter of the previous message is not 0
- and the message is not the first SYNC (or OFS) message in Timeout for which the Sequence Counter is not stuck

then a Time Slave shall check if value of the difference between the Sequence Counter of the current message and the Sequence Counter of the previous SYNC (or respectively OFS) message exceeds the threshold CantSynGlobalTimeSequenceCounterJumpWidth.

If the difference value exceeds the threshold <code>CanTSynGlobalTimeSequenceCounterJumpWidth</code>, then a Time Slave shall consider the <code>SequenceCounter jump</code> as invalid, else as valid. |(RS_TS_20033, RS_TS_20034)

[SWS_CanTSyn_00227]{DRAFT} [Upon reception of a SYNC (or OFS) message, if

- Sequence Counter check is enabled (i.e., CanTSynGlobalTimeSequence-CounterJumpWidth > 0)
- and the Time Domain is in timeout (i.e., TIMEOUT bit set in Time Base synchronization status timeBaseStatus)

a Time Slave shall check the number of consecutive valid Sequence Counter jumps (refer to requirements [SWS_CanTSyn_00224], [SWS_CanTSyn_00225] and [SWS_CanTSyn_00226])

If the number of consecutive valid Sequence Counter jumps exceeds the value CantSynGlobalTimeSequenceCounterHysteresis, a Time Slave shall consider the Sequence Counter value as valid, else as invalid.](RS_TS_20033, RS_TS_20034)

7.5.3.5 CRC Validation

[SWS_CanTSyn_00080] [The function Crc_CalculateCRC8H2F as defined in [6] shall be used to validate the CRC if configured.

| (RS_TS_20034, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00084] [The DataID shall be calculated as DataID = DataIDList[SC], where DataIDList is given by configuration for each message Type.] (RS TS 20034, RS TS 20035)

Note: A specific <code>DataID</code> out of a predefined <code>DataIDList</code> ensures the identification of data elements of time synchronization messages.

[SWS_CanTSyn_00085] [If CanTSynUseExtendedMsgFormat is FALSE, the CRC shall be calculated over Time Synchronization message byte 2 to byte 7 and DataID, where byte 2 is applied first, followed by the other bytes in ascending order, and Data ID last.

If CantSynUseExtendedMsgFormat is TRUE, the CRC shall be calculated over Time Synchronization message byte 2 to byte 15 and DataID for Extended Timesync message formats, where byte 2 is applied first, followed by the other bytes in ascending order, and DataID last.

(RS TS 20034, RS TS 20035, RS TS 20036, RS TS 20068)

7.5.3.6 ICV Verification

Refer to the chapter 7.3.13 in StbM [5] for the configuration details of \mathbb{F}^{\vee} referenced in each Time Domain.

[SWS_CanTSyn_00188] {DRAFT} [When the FV is referenced (refer CanTSyn-IcvVerificationFvIdRef) and FVL > 0 in the received FUP or Extended OFS

message, the Time Slave shall call the ${\tt StbM_GetRxFreshness}$ Api to obtain the Freshness Value by using

- the StbMFreshnessValueId from the reference CanTSynIcvVerificationFvIdRef
- the StbMTruncatedFreshnessValue as received in the FV field of the FUP message
- the StbMTruncatedFreshnessValueLength as received in the FVL field of the FUP message
- the StbMAuthVerifyAttempts as the number of failed verification attempts for the current message (ICV verification attempt counter)
- the StbMFreshnessValueLength from the reference CanTSynIcvVerificationFvIdRef

(RS TS 20073)

[SWS_CanTSyn_00189]{DRAFT} [When the FVL is 0 in the received FUP or Extended OFS message, the Time Slave shall not include the FV in the ICV verification.] (RS TS 20073)

[SWS_CanTSyn_00190]{DRAFT} [When the FV is not referenced (refer CanTSyn-IcvVerificationFvIdRef) and FVL > 0 in the received FUP or Extended OFS message, the Time Slave shall stop the ICV verification and consider ICV verification as failed.] (RS_TS_20073)

[SWS_CanTSyn_00191]{DRAFT} [If StbM_GetRxFreshness returns E_OK, the Time Slave shall use the FV in ICV verification. $|(RS_TS_20073)|$

[SWS_CanTSyn_00193]{DRAFT} [If StbM_GetRxFreshness returned a non-recoverable error code (i.e, E_NOT_OK), then the Time Slave shall

- consider the ICV verification of a received FUP or Extended OFS message as failed
- stop the ICV verification,
- drop the received FUP or Extended OFS message,
- call Det_ReportRuntimeError with the parameter Errorld set to CANTSYN_ E_FRESHNESSFAILURE (refer [SWS_CanTSyn_91001]),
- and call IdsM_SetSecurityEventWithContextData with the parameter EventId set to SEV_TSYN_CAN_FRESHNESS_NOT_AVAILABLE (refer to [SWS CanTSyn 00204])

(RS TS 20073)

Refer to the chapter 10.2.5 in [7] for the configuration details of CSM job used for ICV verification.

[SWS_CanTSyn_00194]{DRAFT} [If CanTSynIcvVerificationBase for the Time Domain is configured to ICV_MAC, the Time Slave shall call Csm_MacVerify to verify the ICV value. $|(RS\ TS\ 20073)|$

[SWS_CanTSyn_00195]{DRAFT} [If CanTSynIcvVerificationBase for the Time Domain is configured to ICV_SIGNATURE, the Time Slave shall call Csm_SignatureVerify to verify the ICV value. | (RS TS 20073)

Note: The mode parameter is intentionally left open for the implementer to choose (i.e. CRYPTO_OPERATIONMODE_SINGLECALL would possibly be the best option since it does not require further calls to CSM).

The CSM job used to generate the ICV can be configured to synchronous or asynchronous behaviour.

[SWS_CanTSyn_00196]{DRAFT} [The ICV verification timeout observation is disabled, when the CSM job to verify ICV is configured in synchronous behaviour. In this case, the CanTSynIcvVerificationTimeout shall be set to 0.|(RS_TS_20073)

[SWS_CanTSyn_00197]{DRAFT} [If Csm_MacVerify or Csm_SignatureVerify returns E_OK, the Time Slave shall start the CanTSynIcvVerificationTimeout.] (RS_TS_20073)

[SWS_CanTSyn_00198]{DRAFT} [The CanTSynIcvVerificationTimeout shall be stopped with the notification of the CanTSyn_IcvVerificationIndication callback.|(RS TS 20073)

[SWS_CanTSyn_00199]{DRAFT} [When <code>Csm_MacVerify or Csm_SignatureVerify return a recoverable error code (e.g., E_BUSY, QUEUE_FULL), then the Time Slave shall</code>

- consider the verification of received FUP or Extended OFS message as failed
- and increment the authentication build counter for this FUP or Extended OFS message.

(RS TS 20073)

[SWS_CanTSyn_00200]{DRAFT} [If one of the following conditions is true:

- the authentication build counter has reached the configuration value CanTSyn-RxAuthenticationBuildAttempts,
- the ICV verification attempt counter has reached the configuration value CanTSynIcvVerificationAttempts
- the verification of the ICV has returned a non-recoverable error such as returning E_NOT_OK or KEY_FAILURE,
- CanTSynIcvVerificationTimeout expires before the notification of the CanTSyn_IcvVerificationIndication callback,

then the Time Slave shall

- stop the ICV verification and consider the ICV verification as failed,
- and call IdsM_SetSecurityEventWithContextData with the parameters EventId set to SEV_TSYN_CAN_ICV_VERIFICATION_FAILED (refer to [SWS CanTSyn 00204])

(RS TS 20073)

[SWS_CanTSyn_00215]{DRAFT} [For every reception of messages that require ICV verification, the Time Slave shall maintain an authentication build counter (refer to CanTSynRxAuthenticationBuildAttempts).|(RS TS 20073)

[SWS_CanTSyn_00216]{DRAFT} [Upon the initial processing of messages that require ICV verification (i.e., upon the first attempt of a freshness and ICV check for each received message), the Time Slave shall set the authentication build counter to 0.] (RS_TS_20073)

[SWS_CanTSyn_00217]{DRAFT} [When StbM_GetRxFreshness returns a recoverable error code (e.g., STBM_E_BUSY), then the Time Slave shall increment the authentication build counter and shall not execute verification of the ICV.|(RS TS 20073)

[SWS_CanTSyn_00218]{DRAFT} [If

- the verification of the authenticated message has failed
- and the authentication build counter has not yet reached the configuration value CanTSynRxAuthenticationBuildAttempts,

then the Time Slave shall retry the freshness attempt and ICV verification in the next call of CantSyn_MainFunction. | (RS_TS_20073)

[SWS_CanTSyn_00219]{DRAFT} If the verification of the ICV could be successfully executed but the verification failed (e.g. the MAC verification has failed or the key was invalid), then the Time Slave shall

- increment the ICV verification attempt counter
- and set the authentication build counter to 0.

(RS TS 20073)

Note: Resetting the authentication build counter will prevent dropping the authentication process too early even though ICV verification attempts are still possible.

7.5.3.7 Message Disassembling

[SWS_CanTSyn_00086] For each received Time Synchronization message the CanTSyn shall validate the message as follows (all conditions must match):

1. Type matches depending on the CantSynRxCrcValidated parameter

- 2. SC value is valid (refer to [SWS_CanTSyn_00221], [SWS_CanTSyn_00222], [SWS_CanTSyn_00223], [SWS_CanTSyn_00224], [SWS_CanTSyn_00225], [SWS_CanTSyn_00226], [SWS_CanTSyn_00227])
- 3. D matches to the defined Time Domain range for each Type
- 4. D matches to one of the configured Time Domains (given by parameter CantSynGlobalTimeDomainId)
- 5. SyncTimeNSec (FUP / OFNS / Extended OFS only) matches the defined range of StbM_TimeStampType.nanoseconds.
- 6. CRC (including DataID) matches depending on the CantSynRxCrcValidated parameter
- 7. ICV matches depending on the CantsynRxIcvVerificationType parameter | (RS_TS_20035, RS_TS_20036, RS_TS_20073)

[SWS_CanTSyn_00087] [If the validation of received Time Synchronization message is successful (refer to [SWS_CanTSyn_00086]), the CanTSyn shall disassemble the message and forward the global time via StbM_BusSetGlobalTime to StbM.] (RS_-TS 20034, RS TS 20035, RS TS 20036, RS TS 20073)

[SWS_CanTSyn_00206] [If the validation of the received Time Synchronization message has failed (refer to [SWS_CanTSyn_00086]), the CanTSyn shall discard the received Time Synchronization message.] (RS_TS_20035, RS_TS_20036, RS_TS_20073)

7.6 Time Recording

7.6.1 Global Time Precision Measurement

[SWS_CanTSyn_00115] [On an invocation of StbM_BusSetGlobalTime the parameter pathDelay of the measureDataPtr structure shall be set to 0. $](RS_TS_20034)$

7.6.2 Time Validation

[SWS_CanTSyn_00137] [The CanTSyn shall support Time Validation, if CanTSyn-TimeValidationSupport set to TRUE. | (RS_TS_00034)

[SWS_CanTSyn_00138] [

- CanTSynTimeValidationSupport is enabled and
- CantSynEnableTimeValidation for the Time Domain is enabled

CanTSyn shall do time recording for Time Validation for that Time Domain (RS TS 00034)

```
[SWS CanTSyn 00139]
```

- time recording for Time Validation is enabled for a Time Domain (refer to [SWS CanTSyn 00137] and [SWS CanTSyn 00138])
- and Cantsyn is configured as Time Slave for that Time Domain,

CanTSyn shall call StbM_CanSetSlaveTimingData upon successful reception of a FUP message.

StbM_CanSetSlaveTimingData shall be called after StbM_BusSetGlobalTime. (RS TS 00034)

Note: StbM_BusSetGlobalTime shall be called first, because it updates the Synclocal Time Tuple (refer to [5]), which is required by StbM_CanSetSlaveTimingData.

[SWS_CanTSyn_00140] [Upon invocation of StbM_CanSetSlaveTimingData CanTSyn shall pass following values

- the sequence counter value from the transmitter (Time Master),
- the segment id of the physical channel on which the SYNC message has been received (refer to parameter CanTSynGlobalTimeNetworkSegmentId)
- T2_{VIT} as syncIngressTimestamp for the SYNC message (refer to step 1 in [SWS_CanTSyn_00144], [SWS_CanTSyn_00147] and [SWS CanTSyn 00148]),
- T0 + T4 as preciseOriginTimestamp received from the Time Master (refer to [SWS CanTSyn 00144] and [SWS CanTSyn 00145])

to the function by the parameter measureDataPtr.

Struct members

- measureDataPtr→referenceLocalTimestamp and
- measureDataPtr→referenceGlobalTimestamp

shall be passed as 0.

(RS_TS_00034)

Note: The Cantsyn passes 0 to avoid undefined values. The structure members referenceLocalTimestamp and referenceGlobalTimestamp will be set by the StbM via StbM_CanSetSlaveTimingData internally (refer to [SWS StbM 00471] in [5]).

```
[SWS CanTSyn 00141]
```

- time recording for Time Validation is enabled for a Time Domain (refer to [SWS_CanTSyn_00137] and [SWS_CanTSyn_00138])
- and CantSyn is configured as Time Master for that Time Domain

CanTSyn shall call StbM_CanSetMasterTimingData upon successful transmission of a SYNC message). | (RS TS 00034)

[SWS_CanTSyn_00142] [Upon invocation of StbM_CanSetMasterTimingData CanTSyn shall pass the following data

- the sequence counter as sent in the SYNC message
- the segment id of the physical channel on which the SYNC message has been sent (refer to parameter CanTSynGlobalTimeNetworkSegmentId)
- T1_{VLT} as the syncEgressTimestamp of SYNC message (refer to [SWS_CanTSyn_00149], [SWS_CanTSyn_00152] and [SWS_CanTSyn_00153]),
- T0_{SYNC} + (T1_{VLT} T0_{VLT}) as precise preciseOriginTimestamp (refer to [SWS_CanTSyn_00149], [SWS_CanTSyn_00151], [SWS_CanTSyn_00152] and [SWS_CanTSyn_00153]),

to the function by the parameter measureDataPtr. | (RS_TS_00034)

7.7 Security Events

[SWS_CanTSyn_00201]{DRAFT} [If security event reporting has been enabled for the CanTSyn module (CanTSynEnableSecurityEventReporting = TRUE) the respective security events shall be reported to the IdsM [8] via the interfaces defined in BSWGeneral [3]. | (RS Ids 00810)

The following table lists the security events which are standardized for the CanTSyn together with their trigger conditions.

[SWS_CanTSyn_00204] Security events for CanTSyn [

Name	Description	ID
SEV_TSYN_CAN_ICV_GENERATION_FAILED	ICV generation for a FUP or Extended OFS message has failed	66
SEV_TSYN_CAN_ICV_VERIFICATION_FAILED	ICV verification of a FUP or Extended OFS message has failed	67
SEV_TSYN_CAN_FRESHNESS_NOT_ AVAILABLE	Failed to get freshness value from FvM	68

 \triangle

Name	Description	ID
SEV_TSYN_CAN_MSG_SEQUENCE_ERROR	Failed to receive correct sequence of SYNC and FUP or OFS and OFNS from the TimeMaster within (CanTSyn GlobalTimeFollowUpTimeout).	69

(RS lds 00810)

The following table describes the context data which shall be reported for the respective security events:

[SWS_CanTSyn_00205] $\{DRAFT\}$ Context data of respective Security events of CanTSyn \lceil

Security Event	Context Data
SEV_TSYN_CAN_ICV_GENERATION_FAILED	Context Data (1 byte) - GlobalTimeDomainId
SEV_TSYN_CAN_ICV_VERIFICATION_FAILED	Context Data (1 byte) - GlobalTimeDomainId
SEV_TSYN_CAN_FRESHNESS_NOT_AVAILABLE	Context Data (1 byte) - GlobalTimeDomainId
SEV_TSYN_CAN_MSG_SEQUENCE_ERROR	Context Data (1 byte) - GlobalTimeDomainId

(RS Ids 00810)

7.8 Error Classification

Section 7.2 "Error Handling" of the document "General Specification of Basic Software Modules" [3] describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.8.1 Development Errors

[SWS_CanTSyn_00089] Definiton of development errors in module CanTSyn [

Type of error	Related error code	Error value
API service called with wrong PDU or SDU	CANTSYN_E_INVALID_PDUID	0x01
API service used in un-initialized state	CANTSYN_E_UNINIT	0x02
A pointer is NULL	CANTSYN_E_NULL_POINTER	0x03
CanTSyn initialization failed	CANTSYN_E_INIT_FAILED	0x04
API called with invalid parameter	CANTSYN_E_PARAM	0x05
Invalid Controller index	CANTSYN_E_INV_CTRL_IDX	0x06

(SRS_BSW_00385)

7.8.2 Runtime Errors

[SWS_CanTSyn_91001] Definiton of runtime errors in module CanTSyn [

Type of error	Related error code	Error value
No FV available from the FVM	CANTSYN_E_FRESHNESSFAILURE	0x01

(SRS_BSW_00385)

7.8.3 Transient Faults

There are no transient faults.

7.8.4 Production Errors

There are no production errors.

7.8.5 Extended Production Errors

There are no extended production errors.

8 API specification

8.1 Imported types

In this section all types included from the following files are listed:

[SWS_CanTSyn_00090] Definition of imported datatypes of module CanTSyn [

Module	Header File	Imported Type
Can	Can_GeneralTypes.h	Can_TimeStampType (draft)
ComStack_Types	ComStack_Types.h	PduldType
	ComStack_Types.h	PduInfoType
	ComStack_Types.h	PduLengthType
Csm	Rte_Csm_Type.h	Crypto_OperationModeType
	Rte_Csm_Type.h	Crypto_ResultType
	Rte_Csm_Type.h	Crypto_VerifyResultType
Eth	Eth.h	Eth_RateDeviationStatusType (draft)
	Eth.h	Eth_RateDeviationType (draft)
IdsM	ldsM_Types.h	IdsM_SecurityEventIdType
StbM	Rte_StbM_Type.h	StbM_CanTimeMasterMeasurementType
	Rte_StbM_Type.h	StbM_CanTimeSlaveMeasurementType
	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType
	Rte_StbM_Type.h	StbM_TimeBaseStatusType
	Rte_StbM_Type.h	StbM_TimeStampShortType
	Rte_StbM_Type.h	StbM_TimeStampType
	Rte_StbM_Type.h	StbM_TimeTupleType
	Rte_StbM_Type.h	StbM_UserDataType
	StbM.h	StbM_MeasurementType
	StbM.h	StbM_VirtualLocalTimeType
Std	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

](RS_TS_20035)

8.2 Type definitions

8.2.1 CanTSyn_ConfigType

[SWS_CanTSyn_00091] Definition of datatype CanTSyn_ConfigType [

Name	CanTSyn_ConfigType
Kind	Structure
Elements	implementation specific

 \triangle

	Туре	-
	Comment	_
Description	This is the base type for the configuration of the Time Synchronization over CAN. A pointer to an instance of this structure will be used in the initialization of the Time Synchronization over CAN.	
	The content of this structure is defined in chapter 10 Configuration specification.	
Available via	CanTSyn.h	

(RS_TS_20035)

8.2.2 CanTSyn_TransmissionModeType

$[SWS_CanTSyn_00092] \ Definition \ of \ data type \ CanTSyn_Transmission ModeType \\ [Subsection of the context of the conte$

Name	CanTSyn_TransmissionModeType			
Kind	Enumeration			
Range	CANTSYN_TX_OFF – Transmission Disabled			
	CANTSYN_TX_ON - Transmission Enabled			
Description	Handles the enabling and disabling of the transmission mode			
Available via	CanTSyn.h			

(RS_TS_20035)

8.3 Function definitions

8.3.1 CanTSyn_Init

[SWS_CanTSyn_00093] Definition of API function CanTSyn_Init [

Service Name	CanTSyn_Init		
Syntax	<pre>void CanTSyn_Init (const CanTSyn_ConfigType* configPtr)</pre>		
Service ID [hex]	0x01		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	configPtr	Pointer to selected configuration structure	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	This function initializes the	This function initializes the Time Synchronization over CAN.	
Available via	CanTSyn.h		

(RS_TS_20035)

CANTSYN_E_INIT_FAILED is reported as specified by [SWS_BSW_00050] in [3]. See section 7.2.2 for details.

8.3.2 CanTSyn_GetVersionInfo

[SWS_CanTSyn_00094] Definition of API function CanTSyn_GetVersionInfo

Service Name	CanTSyn_GetVersionInfo		
Syntax	void CanTSyn_GetVersionInfo (Std_VersionInfoType* versioninfo)		
Service ID [hex]	0x02		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	versioninfo	Pointer to where to store the version information of this module.	
Return value	None		
Description	Returns the version information of this module.		
Available via	CanTSyn.h	CanTSyn.h	

(RS TS 20035)

8.3.3 CanTSyn_SetTransmissionMode

[SWS_CanTSyn_00095] Definition of API function CanTSyn_SetTransmission Mode \lceil

Service Name	CanTSyn_SetTransmission	nMode	
Syntax	uint8 CtrlIdx,	<pre>void CanTSyn_SetTransmissionMode (uint8 CtrlIdx, CanTSyn_TransmissionModeType Mode)</pre>	
Service ID [hex]	0x03		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	Ctrlldx	Ctrlldx Index of the CAN channel	
	Mode	Mode CANTSYN_TX_OFF CANTSYN_TX_ON	
Parameters (inout)	None	None	
Parameters (out)	None	None	
Return value	None	None	
Description	This API is used to turn on	and off the TX capabilities of the CanTSyn.	
Available via	CanTSyn.h		

(RS_TS_20035)

[SWS_CanTSyn_00134] [The function CanTSyn_SetTransmissionMode shall inform the Det, if development error detection is enabled (i.e., CanTSynDevErrorDetect is set to TRUE) and if function call has failed because of the following reasons:

- Invalid Ctrlldx (CANTSYN E INV CTRL IDX)
- Invalid Mode (CANTSYN_E_PARAM)

(SRS BSW 00323, SRS BSW 00337)

8.4 Callback notifications

This is a list of functions provided for other modules.

8.4.1 CanTSyn RxIndication

[SWS_CanTSyn_00096] Definition of callback function CanTSyn_RxIndication [

Service Name	CanTSyn_RxIndication		
Syntax	<pre>void CanTSyn_RxIndication (PduIdType RxPduId, const PduInfoType* PduInfoPtr)</pre>		
Service ID [hex]	0x42		
Sync/Async	Synchronous		
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.		
Parameters (in)	RxPduld ID of the received PDU. PduInfoPtr Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.		
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Indication of a received PDL	J from a lower layer communication interface module.	
Available via	CanTSyn.h		

(RS TS 20035)

Note: The callback function CanTSyn_RxIndication called by the CAN Interface and implemented by the CanTSyn module. It is called in case of a receive indication event of the CAN Driver.

[SWS_CanTSyn_00097] [The callback function <code>CanTSyn_RxIndication</code> shall inform the <code>Det</code>, if development error detection is enabled (<code>CanTSynDevErrorDetect</code> is set to TRUE) and if function call has failed because of the following reasons:

- Invalid PDU ID (CANTSYN E INVALID PDUID)
- PduInfoPtr or SduDataPtr equals NULL_PTR (CANTSYN_E_NULL_POINTER)

(SRS BSW 00323, SRS BSW 00337)

Caveats of CanTSyn_RxIndication:

• Until this service returns, the CAN Interface will not access <code>canSduPtr</code>. The <code>canSduPtr</code> is only valid and can be used by upper layers until the indication returns. The CAN Interface guarantees that the number of configured bytes for this <code>CanTSynRxPduId</code> is valid. The call context is either on interrupt level (interrupt mode) or on task level (polling mode). This callback service is re-entrant for multiple CAN controller usage.

Note: Using polling mode as call context significantly increases the latency and thus reduces the precision. It is therefore highly recommended to only use interrupt mode.

• The Cantsyn module is initialized correctly.

8.4.2 CanTSyn_TxConfirmation

[SWS_CanTSyn_00099] Definition of callback function CanTSyn_TxConfirmation

Service Name	CanTSyn_TxConfirmation		
Syntax	<pre>void CanTSyn_TxConfirmation (PduIdType TxPduId, Std_ReturnType result)</pre>		
Service ID [hex]	0x40		
Sync/Async	Synchronous		
Reentrancy	Reentrant for different Pdule	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in)	TxPduld	ID of the PDU that has been transmitted.	
	result E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.		
Parameters (inout)	None		
Parameters (out)	None	None	
Return value	None		
Description	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.		
Available via	CanTSyn.h		

(RS TS 20035)

Note: The callback function CanTSyn_TxConfirmation is called by the CAN Interface and implemented by the CanTSyn module.

[SWS_CanTSyn_00100] [The callback function CanTSyn_TxConfirmation shall inform the Det, if development error detection is enabled (CanTSynDevErrorDetect is set to TRUE) and if the function call has failed because of the following reason:

• Invalid PDU ID (CANTSYN_E_INVALID_PDUID), i.e., a PDU ID not configured by parameter CantSynGlobalTimeMasterConfirmationHandleId

(SRS BSW 00323, SRS BSW 00337)

Caveats of CanTSyn_TxConfirmation:

• The call context is either on interrupt level (interrupt mode) or on task level (polling mode). This callback service is re-entrant for multiple CAN controller usage.

Note: Using polling mode as call context significantly increases the latency and thus reduces the precision. It is therefore highly recommended to only use interrupt mode.

• The Cantsyn module is initialized correctly.

8.4.3 CanTSyn_lcvGenerationIndication

[SWS_CanTSyn_91002]{DRAFT} Definition of API function CanTSyn_IcvGenerationIndication \lceil

Service Name	CanTSyn_lcvGenerationInd	ication (draft)	
Syntax	<pre>void CanTSyn_IcvGenerationIndication (uint32 jobId, Crypto_ResultType result)</pre>		
Service ID [hex]	0x7		
Sync/Async	Synchronous		
Reentrancy	Reentrant	Reentrant	
Parameters (in)	jobId JobID of the operation that caused the callback.		
	result Contains the result of the cryptographic operation.		
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	By this API service the CanTSyn gets an indication and the result of ICV generation.		
	Tags: atp.Status=draft		
Available via	CanTSyn.h		

(RS TS 20073)

[SWS_CanTSyn_00202]{DRAFT} [The function CanTSyn_IcvGenerationIndication shall inform the DET, if development error detection is enabled (CanTSynDevErrorDetect is set to TRUE) and if function call has failed because of the following reasons:

• jobId is invalid (CANTSYN_E_PARAM)

(SRS BSW 00323, SRS BSW 00337)

8.4.4 CanTSyn_IcvVerificationIndication

[SWS_CanTSyn_91003]{DRAFT} Definition of API function CanTSyn_IcvVerificationIndication

Service Name	CanTSyn_lcvVerificationInd	ication (draft)
Syntax	<pre>void CanTSyn_IcvVerificationIndication (uint32 jobId, Crypto_ResultType result)</pre>	
Service ID [hex]	0x8	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	jobId JobID of the operation that caused the callback. result Contains the result of the cryptographic operation.	
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	By this API service the CanTSyn gets an indication and the result of ICV verification.	
	Tags: atp.Status=draft	
Available via	CanTSyn.h	

(RS_TS_20073)

[SWS_CanTSyn_00203]{DRAFT} [The function CanTSyn_lcvVerificationIndication() shall inform the DET, if development error detection is enabled (CanTSynDevErrorDetect is set to TRUE) and if function call has failed because of the following reasons:

• jobld is invalid (CANTSYN E PARAM)

(SRS BSW 00323, SRS BSW 00337)

8.5 Scheduled functions

These functions are directly called by the Basic Software Scheduler. The following functions shall have no return value and no parameters. All functions shall be non-reentrant.

8.5.1 CanTSyn_MainFunction

[SWS_CanTSyn_00102] Definition of scheduled function CanTSyn_MainFunction \lceil

Service Name	CanTSyn_MainFunction
Syntax	void CanTSyn_MainFunction (void)
Service ID [hex]	0x06
Description	Main function for cyclic call / resp. Timesync message transmission
Available via	CanTSyn_SchM.h

(RS TS 20035)

[SWS_CanTSyn_00103] [The frequency of invocations of CanTSyn_MainFunction is determined by the configuration parameter CanTSynMainFunctionPeriod.|(RS TS 20035)

8.6 Expected interfaces

In this chapter all interfaces required from other modules are listed.

8.6.1 Mandatory interfaces

Note: This section defines all interfaces, which are required to fulfill the core functionality of the module.

[SWS_CanTSyn_00105] Definition of mandatory interfaces in module CanTSyn [

API Function	Header File	Description
StbM_GetCurrentVirtualLocalTime	StbM.h	Returns the Virtual Local Time of the referenced Time Base.

(RS_TS_20035)

8.6.2 Optional interfaces

This section defines all interfaces, which are required to fulfill an optional functionality of the module.

[SWS_CanTSyn_00106] Definition of optional interfaces in module CanTSyn \lceil

API Function	Header File	Description
CanIf_EnableEgressTimeStamp (draft)	Canlf.h	This service calls the corresponding CAN Driver service to activate egress time stamping on a dedicated message object.
		Tags: atp.Status=draft
Canlf_GetCurrentTime (draft)	Canlf.h	This service calls the corresponding CAN Driver service to retrieve the current time value out of the HW registers.
		Tags: atp.Status=draft
CanIf_GetEgressTimeStamp (draft)	Canlf.h	This service calls the corresponding CAN Driver service to read back the egress time stamp on a dedicated message object. It needs to be called within the TxConfirmation() function.
		Tags: atp.Status=draft
CanIf_GetIngressTimeStamp (draft)	Canlf.h	This service calls the corresponding CAN Driver service to reads back the ingress time stamp on a dedicated message object. It needs to be called within the RxIndication() function.
		Tags: atp.Status=draft
CanIf_Transmit	Canlf.h	Requests transmission of a PDU.
Crc_CalculateCRC8H2F	Crc.h	This service makes a CRC8 calculation with the Polynomial 0x2F on Crc_Length
Csm_MacGenerate	Csm.h	Uses the given data to perform a MAC generation and stores the MAC in the memory location pointed to by the MAC pointer.
Csm_MacVerify	Csm.h	Verifies the given MAC by comparing if the MAC is generated with the given data.
Csm_SignatureGenerate	Csm.h	Uses the given data to perform the signature calculation and stores the signature in the memory location pointed by the result pointer.
Csm_SignatureVerify	Csm.h	Verifies the given MAC by comparing if the signature is generated with the given data.
Det_ReportError	Det.h	Service to report development errors.
Det_ReportRuntimeError	Det.h	Service to report runtime errors. If a callout has been configured then this callout shall be called.
ldsM_SetSecurityEventWithContext Data	ldsM.h	This API is the application interface to report security events with context data to the IdsM.
StbM_BusSetGlobalTime	StbM.h	Allows the Time Base Provider Modules to forward the Rx Time Tuple to the StbM.
StbM_CanSetMasterTimingData (draft)	StbM_CanTSyn.h	Provides CAN Timesyn module specific data for a Time Master to the StbM.
		Tags: atp.Status=draft
StbM_CanSetSlaveTimingData (draft)	StbM_CanTSyn.h	Allows the CanTSyn Module to forward CAN specific details to the StbM.
		Tags: atp.Status=draft
StbM_GetCurrentTime	StbM.h	Returns a time tuple (Local time, Global time and Timebase status) and user data details Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).
StbM_GetOffset	StbM.h	Allows the Timesync Modules to get the current Offset Time and User Data.

Specification of Time Synchronization over CAN AUTOSAR CP R23-11

\triangle

API Function	Header File	Description	
StbM_GetRxFreshness (draft)	StbM.h	This interface is used by the StbM to query the current freshness value.	
		Tags: atp.Status=draft	
StbM_GetTimeBaseStatus	StbM.h	Returns detailed status information for a Synchronized (or Pure Local) Time Base and, if called for an Offset Time Base, for the Offset Time Base and the underlying Synchronized Time Base.	
StbM_GetTimeBaseUpdateCounter	StbM.h	Allows the Timesync Modules to detect, whether a Time Base should be transmitted immediately in the subsequent <bus>TSyn_MainFunction() cycle.</bus>	
StbM_GetTxFreshness (draft)	StbM.h	This API returns the freshness value from the Mo- Significant Bits in the first byte, of the Freshness array, in big endian format.	
		Tags: atp.Status=draft	
StbM_GetTxFreshnessTruncData (draft)	StbM.h	This interface is used by the StbM to obtain the current freshness value. The interface function provides also the truncated freshness transmitted in the secured time sync message.	
		Tags: atp.Status=draft	
StbM_SPduTxConfirmation (draft)	StbM.h	This interface is used by the StbM to indicate that the Secured Time Synchronization Message has been initiated for transmission.	
		Tags: atp.Status=draft

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module CanTSyn.

Chapter 10.4 specifies published information of the module Cantsyn.

10.1 How to read this chapter

For details refer to the chapter 10.1 "Introduction to configuration specification" in [3].

10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapter 7 and Chapter 8.

10.2.1 Variants

[SWS_CanTSyn_00108] [The Time Synchronization over CAN shall support the configuration for Time Master, Time Slave and Time Gateway. | (RS_TS_20038)

The module supports different post-build variants (previously known as post-build selectable configuration sets), but not post-build loadable configuration.

10.2.2 CanTSvn

SWS Item	[ECUC_CanTSyn_00001]
Module Name	CanTSyn
Description	Configuration of the Synchronized Time-base Manager (StbM) module with respect to global time handling on CAN.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-PRE-COMPILE

Included Containers					
Container Name	Multiplicity	Scope / Dependency			
CanTSynGeneral	1	This container holds the general parameters of the CAN-specific Synchronized Time-base Manager			
CanTSynGlobalTimeDomain	1*	This represents the existence of a global time domain on CAN. The CanTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains.			
		If the CanTSyn exists it is assumed that at least one global time domain exists.			

10.2.3 CanTSynGeneral

10.2.5 CanTSynGlobalTimeDomain

SWS Item	[ECUC_CanTSyn_00004]
Container Name	CanTSynGlobalTimeDomain
Parent Container	CanTSyn
Description	This represents the existence of a global time domain on CAN. The CanTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains.
	If the CanTSyn exists it is assumed that at least one global time domain exists.
Configuration Parameters	

SWS Item	[ECUC_CanTSyn_00051]			
Parameter Name	CanTSynEnableTimeValidation			
Parent Container	CanTSynGlobalTimeDomain	CanTSynGlobalTimeDomain

10.2.17 CanTSynGlobalTimeSlave

SWS Item	[ECUC_CanTSyn_00012]		
Container Name	CanTSynGlobalTimeSlave		
Parent Container	CanTSynGlobalTimeDomain		
Description	Configuration of a Time Slave for a Time Domain (refer to parent container). If Can TSynGlobalTimeSlave container exists, the local ECU acts as a Time Slave for the Time Domain.		
Post-Build Variant Multiplicity	true		
Multiplicity Configuration Class	Pre-compile time X All Variants		
	Link time	_	
	Post-build time	_	
Configuration Parameters			

SWS Item	[ECUC_CanTSyn_00006]			
Parameter Name	CanTSynGlobalTimeFollowUpTimeout			
Parent Container	CanTSynGlobalTimeSlave			
Description	Rx timeout for the follow-up message. This is only relevant for selected bus systems Unit:seconds			
Multiplicity	1			
Туре	EcucFloatParamDef			
Range	[0 INF]			
Default value	-			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	Х	All Variants	
	Link time	_		
	Post-build time –			
Scope / Dependency	scope: local			

SWS Item	[ECUC_CanTSyn_00068]			
Parameter Name	CanTSynGlobalTimeRxDebounce	CanTSynGlobalTimeRxDebounceTime		
Parent Container	CanTSynGlobalTimeSlave			
Description	This represents the configuration of and OFNS. Unit: seconds	This represents the configuration of a RX debounce time for the Sync and FUP, OFS and OFNS. Unit: seconds		
Multiplicity	1	1		
Туре	EcucFloatParamDef	EcucFloatParamDef		
Range	[0 4]	[04]		
Default value	-	-		
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	X	All Variants	
	Link time –			
	Post-build time –			
Scope / Dependency	scope: local			

SWS Item	[ECUC_CanTSyn_00053]	
Parameter Name	CanTSynGlobalTimeSequenceCounterHysteresis	
Parent Container	CanTSynGlobalTimeSlave	

Description	CanTSynGlobalTimeSequenceCounterHysteresis specifies the number of consecutive valid message pairs that are required by the Time Slave while being in Timeout state until a Time Tuple is forwarded to the StbM.		
Multiplicity	1		
Туре	EcucIntegerParamDef		
Range	0 15		
Default value	0		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	_	
	Post-build time	_	
Scope / Dependency	scope: local		

SWS Item	[ECUC_CanTSyn_00011]			
Parameter Name	CanTSynGlobalTimeSequenceCounterJumpWidth			
Parent Container	CanTSynGlobalTimeSlave			
Description	The SequenceCounterJumpWidth specifies the maximum allowed gap of the Sequence Counter between two SYNC resp. two OFS messages.			
Multiplicity	1			
Туре	EcucIntegerParamDef			
Range	0 15			
Default value	0			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	Х	All Variants	
	Link time –			
	Post-build time –			
Scope / Dependency	scope: local			

SWS Item	[ECUC_CanTSyn_00021]	[ECUC_CanTSyn_00021]			
Parameter Name	CanTSynRxCrcValidated	CanTSynRxCrcValidated			
Parent Container	CanTSynGlobalTimeSlave	CanTSynGlobalTimeSlave			
Description	Definition of whether or not validate	tion of the CRC is supported.			
Multiplicity	1				
Туре	EcucEnumerationParamDef				
Range	CRC_IGNORED	The Timesync module accepts Time Synchronization messages, which are CRC secured (without actually validating the CRC) and those, which are not CRC secured. That means, the Timesync module ignores the CRC.			
	CRC_NOT_VALIDATED	The Timesync module accepts only Time Synchronization messages, which are not CRC secured. All other Time Synchronization messages are ignored.			
	CRC_OPTIONAL	The Timesync module accepts only Time Synchronization messages which are not CRC secured and Time Synchronization messages which are CRC secured and have the correct CRC. All other Time Synchronization messages are ignored.			

	CRC_VALIDATED	The Timesync module accepts only Time Synchronization messages, which are CRC secured and have the correct CRC. All other Time Synchronization messages are ignored.	
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X All Variants	
	Link time	_	
	Post-build time	-	
Scope / Dependency	scope: local		

SWS Item	[ECUC_CanTSyn_00075]			
Parameter Name	CanTSynRxIcvVerificationType			
Parent Container	CanTSynGlobalTimeSlave			
Description	This parameter controls whether or	not ICV v	rerification shall be supported.	
	Tags: atp.Status=draft			
Multiplicity	1			
Туре	EcucEnumerationParamDef			
Range	ICV_IGNORED	The Timesync module accepts Time Synchronization messages, which are ICV secured (without actually validating the ICV) and those which are not ICV secured. That means, the Timesync module ignores the ICV.		
	LOV NOT VERIFIED	 	atp.Status=draft	
	ICV_NOT_VERIFIED	The Timesync module accepts only Time Synchronization messages, which are not ICV secured. All other Time Synchronization messages are ignored.		
		Tags:	atp.Status=draft	
	ICV_OPTIONAL	The Timesync module accepts only Time Synchronization messages which are not ICV secured and Time Synchronization messages which are ICV secured and have the correct ICV. All other Time Synchronization messages are ignored.		
		Tags: atp.Status=draft		
	ICV_VERIFIED	The Timesync module accepts only Time Synchronization messages, which are ICV secured and have the correct ICV. All other Time Synchronization messages are ignored.
