#### 1 Introduction and functional overview

This document specifies the functionality, API and the configuration of the AUTOSAR Basic Software module Vehicle-2-X Management (V2xM). The Vehicle-2-X Management module together with the Vehicle-2-X Facilities (V2xFac) [1], Vehicle-2-X Data Manager (V2xDM) [2], Vehicle-2-X Basic Transport Protocol (V2xBtp) [3], the Vehicle-2-X GeoNetworking (V2xGn) [4] and the communication driver layer [5] [6] [7] forms the V2X stack within the AUTOSAR architecture.

V2xM is designed to be hardware independent. It controls and supports the services of V2X protocol stack entities.

Note that figures in this document are not regarded as requirements.

#### 1.1 Architectural overview

The position of the V2xM module within the Layered Software Architecture is shown below.

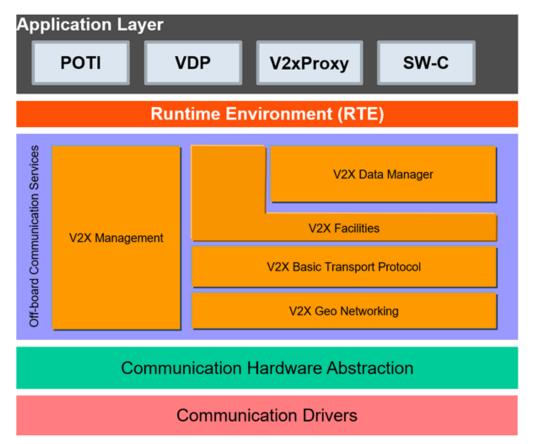

Figure 1.1: AUTOSAR BSW software architecture - V2xM scope

#### 1.2 Functional overview

The V2xM module manages the operation of the V2X protocol stack. It does support the V2X protocol stack modules with a number of services and furthermore provide some Application interfaces to let applications control the V2X-Stack within the limited range that the ETSI/C2C-CC Requirements left for applications..

#### 1.2.1 Position and Time management (POTI)

Within the AUTOSAR architecture, the POTI service is a V2X Application within the Application layer. The V2xM module takes positional information from the POTI service and makes is available to the V2xFac and V2xGn modules [8].

#### 1.2.2 Identity

A V2X Station has one identity that is used by every V2X module, that uses identity in its header information. For security and privacy reasons, the identity changes over time and travel distance. All modules that are using the identity shall be notified.

#### 1.2.3 Security

V2xM provides standardized security services to the V2X-Stack according to ETSI specification, this includes signing and verification of messages as described in [9]. The APIs shall be implemented using CSM services provided by AUTOSAR.

#### 1.2.4 Decentralized Congestion Control (DCC)

V2xM provides congestion control services for the V2X Stack, to provide the current V2X radio congestion state for a specific channel.

## 2 Acronyms and Abbreviations

The glossary below includes acronyms and abbreviations relevant to the V2xManagement module that are not included in the AUTOSAR glossary [10].

Abbreviation / Acronym:	Description:
DEM	Diagnostic Event Manager
DET	Default Error Tracer
API	Application Programming Interface
BSW	Basic Software
ВТР	Basic Transport Protocol
CAM	Cooperative Awareness Message
DCC	Decentralized Congestion Control
DENM	Decentralized Environmental Notification Messages
EcuM	Electronic Control Unit Manager
ITS	Intelligent Transport System
LTC	Long Term Certificate
POTI	Position and Time management
VOD	Verification on Demand
hashedID8	Calculated by first computing the SHA 256 hash of the Authorisation Ticket, and then taking the least significant eight bytes from the hash output
ECDSA	Elliptic Curve Digital Signature Algorithm

Table 2.1: Acronyms and abbreviations used in the scope of this Document

#### 3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [11], which is also valid for V2xM.

Thus, the specification SWS BSW General shall be considered as additional and required specification for V2xM.

## 4 Constraints and assumptions

#### 4.1 Limitations

No limitations.

## 4.2 Applicability to car domains

This specification is applicable to all car domains.

## 4.3 Authorisation Tickets and Pseudonyms

The Authorisation Ticket (AT) is referred to as Pseudonym in this document.

## 5 Dependencies to other modules

This section describes the relations of the V2xM module to other modules within the AUTOSAR basic software architecture. It outlines the modules that are required or optional for the realization of the V2xM module and the V2xM services that these modules use.

### **5.1 AUTOSAR DET (Default Error Tracer)**

In development mode, the V2xM module reports errors through the Det\_ReportError function of the DET Module [12].

## 5.2 AUTOSAR EcuM (Ecu State Manager)

The EcuM [13] initializes the V2xM module.

## **5.3 AUTOSAR CSM (Cryptographic Service Manager)**

The CSM module is used for cryptographic calculations, needed by the V2X-Stack to secure packets. Therefore, sign and verify and other services of the CSM are being used.

## 5.4 AUTOSAR NvM (NVRAMManager)

The NvM [14] is used by V2xM to load certificates used for pseudonyms, signature generation and verification of V2X messages. Furthermore, the last ignition-time (startup-time of the v2x stack) is stored and loaded by NvM.

## 5.5 AUTOSAR Math libraries (Mfl, Efx)

For mathematical calculations, the Mfl or the Efx library is needed.

## 5.6 File structure

#### 5.6.1 Code file structure

For details refer to the chapter 5.1.6 "Code file structure" in "General Specification of Basic Software Modules" [11].

## 6 Requirements Tracing

The following tables reference the requirements specified in [15] and [16] and links to the fulfillment of these. Please note that if column "Satisfied by" is empty for a specific requirement this means that this requirement is not fulfilled by this document.

#### Note:

Requirement IDs within this document have an encoding to state where each requirement has its origin:

- SWS items starting with a leading 0 (SWS\_V2xM\_0xxxx) are module specific and not inherited.
- SWS items starting with a leading 2 (SWS\_V2xM\_2xxxx) are inherited from C2C-CC Basic System Profile

Requirement	Description	Satisfied by
[SRS_BSW_00345]	BSW Modules shall support pre-compile configuration	[SWS_V2xM_00191]
[SRS_BSW_00414]	Init functions shall have a pointer to a configuration structure as single parameter	[SWS_V2xM_00118]
[SRS_BSW_00457]	Callback functions of Application software components shall be invoked by the Basis SW	[SWS_V2xM_00163]
[SRS_V2X_00010]	The implementation of the V2X system shall follow additional guidance given by C2C-CC requirements	[SWS_V2xM_20182] [SWS_V2xM_20183] [SWS_V2xM_20191] [SWS_V2xM_20192]
[SRS_V2X_00163]	The "verification" of a message shall comprise at least cryptographic verification of the message's signature	[SWS_V2xM_00130] [SWS_V2xM_00199] [SWS_V2xM_20170]
[SRS_V2X_00174]  The V2X system shall suppo origin authentication for the r (long-term or pseudonym) puthat are provided in certificate requests		[SWS_V2xM_00199] [SWS_V2xM_00200] [SWS_V2xM_20180] [SWS_V2xM_20411]
[SRS_V2X_00176]	The V2X system shall change pseudonyms	[SWS_V2xM_00201]
[SRS_V2X_00184]	The V2X system shall allow applications to block the pseudonym change	[SWS_V2xM_00005] [SWS_V2xM_00099]
[SRS_V2X_00190]	The V2X system shall handle vehicle states in a consistent manner	[SWS_V2xM_00095]
[SRS_V2X_00193]	The V2X system shall use ITS time as time base	[SWS_V2xM_00126]
[SRS_V2X_00279]	The V2X system shall support circular, rectangular and ellipsoidal geographical areas	[SWS_V2xM_00113]
[SRS_V2X_00280]	The V2X system shall use high-accuracy methods to calculate the distance between two coordinates	[SWS_V2xM_00176] [SWS_V2xM_00177]

 $\triangle$ 

Requirement	Description	Satisfied by
[SRS_V2X_00322]	The V2X system shall provide services to avoid channel congestion of the shared media	[SWS_V2xM_00188] [SWS_V2xM_00189] [SWS_V2xM_20238] [SWS_V2xM_20240]
[SRS_V2X_00406]	The end-to-end security envelope shall be generated depending on the message type	[SWS_V2xM_00038] [SWS_V2xM_00074] [SWS_V2xM_00135]
[SRS_V2X_00407]	The signature in the end-to-end security envelope shall be generated using a private key corresponding to a valid authorization ticket (pseudonym certificate)	[SWS_V2xM_00074] [SWS_V2xM_00135]
[SRS_V2X_00412]	The V2X system shall inform the driver about the expiration of the pseudonym certificates	[SWS_V2xM_00095]
[SRS_V2X_00413]	The V2X system shall inform the driver about the expiration of the Long Term Certificates	[SWS_V2xM_00095]
[SRS_V2X_00531]	The V2X system's Networking Layer shall support addressing based on geographic coordinates	[SWS_V2xM_00035]
[SRS_V2X_00711]	The V2X system's CA basic service shall be compliant to ETSI Specification of Cooperative Awareness Basic Service	[SWS_V2xM_20293]
[SRS_V2X_10101]	The V2X system shall follow the recommendations of European Certificate Policy and of European Security Policy	[SWS_V2xM_20177] [SWS_V2xM_20179] [SWS_V2xM_20402] [SWS_V2xM_20409]

Table 6.1: RequirementsTracing

## 7 Functional specification

#### 7.1 Startup behavior

[SWS\_V2xM\_00001] [The function V2xM\_Init() of the V2xM shall initialize the internal states of the V2xM module. | ()

[SWS\_V2xM\_00196] [The function V2xM\_Init() of the V2xM shall initialize the underlying MCAL/ECUAL modules WEth and WEthTrcv with a call to EthIf\_SetControllerMode with the respective configured EthIfController V2xMEthIfCtrlRef. | ()

**[SWS\_V2xM\_00197]** [The Ethernet State Manager (EthSm) shall not be involved in the startup of the wireless communication stack. | ()

Note: See Figure 9.5 for the initialization of the wireless communication stack MCAL/E-CUAL modules.

#### 7.2 Shutdown behavior

**[SWS\_V2xM\_00198]** [The Wireless Communication is active until the ECU hardware is being shut down or reset. There are no means to stop the Vehicle-2-X wireless communication in advance.] ()

## 7.3 Identity management

**[SWS\_V2xM\_00004]** The V2xM module shall implement the identity management, also known as the pseudonym. Specific V2X modules shall be notified with the current identity to ensure a consistent value is used in each layer of the V2X Stack. ()

**[SWS\_V2xM\_20182]** [The V2xM module shall change all addresses and identifiers of other layers transmitted over the wireless communication media (such as StationId in CAM/DENM, GeoNetworking Source Address, MAC Source Address) when the used pseudonym changes. Those changes are necessary to ensure the privacy of the user.] (SRS\_V2X\_00010)

Note: In V2xFac, the identity is represented in the Station Id, in V2xGn the identity is represented in the GeoNetworking address, in the Wireless Ethernet Driver the identity is represented in the MAC address.

[SWS\_V2xM\_20183] [All identifiers according to [SWS\_V2xM\_20182] (MAC Source Address, StationId in CAM/DENM, GN Source Address) shall be derived from the "Certificate digest" / "hashedId8". The required number of least significant bytes of the "Certificate digest" / "hashedId8" shall be used as respective identifier. ] (SRS\_V2X\_00010)

[SWS\_V2xM\_00005] [The V2xM module shall provide a mechanism to permit V2X modules to inhibit the identity change for a duration of maximum 15 minutes (e.g. dur-

ing DENM event) via an API call to V2xM\_LockPseudonymChange(). [(SRS\_V2X\_-00184)

**[SWS\_V2xM\_00099]** The V2xM shall not inhibit an identity change when the pseudonym identity expires (i.e. when the certificate that provides the current pseudonym expires within the period where the identity change inhibit was requested). *(SRS\_V2X\_00184)* 

**[SWS\_V2xM\_00006]** [The function V2xM\_Init shall initialize the identity management and provide an initial identity to the V2X protocol stack modules. | ()

**[SWS\_V2xM\_00201]** The V2xM identity management shall initiate a first change of pseudonym during the trip randomly in a range of 800 to 1500 meters from the start position.

The second pseudonym change shall be performed at least 800 m from the last pseudonym change and randomly within an additional interval of 2 to 6 minutes.

The third pseudonym change shall be performed after 15 kilometers  $\pm$  5 kilometers (randomly)

Further pseudonym changes shall be performed every further 30 kilometers  $\pm$  5 kilometers (randomly)|(SRS V2X 00176)

**[SWS\_V2xM\_20180]** [V2xM shall use the pseudonym validity periods as defined by the Authorisation Authority (AA) in conformance to the rules of the Root Certification Authority (RCA).]  $(SRS_V2X_00174)$ 

**[SWS\_V2xM\_20411]** [In case that an V2xM module has no valid pseudonym certificates for signing messages, it shall stop transmitting messages that use the security profiles specified in [17], clause 7.1.1, clause 7.1.2, and clause 7.1.3.] (SRS\_V2X\_-00174)

[SWS\_V2xM\_00008] [The V2xM\_MainFunction() shall be used to initiate a change of the identity. | ()

Note: The V2xM\_MainFunction() can also be used for software implementation specific execution of cyclic tasks.

**[SWS\_V2xM\_00100]** The V2xM shall initiate a change of the pseudonym within two phases. A first prepare phase and a second commit or abort phase. The second phase depends on the result of all called modules within the first phase. If the first phase was successful, the commit phase shall be initiated, if the first phase was unsuccessful, the abort phase shall be initiated. ()

**[SWS\_V2xM\_00101]** In the prepare phase, the desired API <Module>\_PreparePseudonymChange() shall be called.] ()

**[SWS\_V2xM\_00102]** In the commit phase, the desired API <Module>\_CommitPseudonymChange() shall be called.  $\rfloor$  ()

**[SWS\_V2xM\_00103]** In the abort phase, the desired API <Module>\_AbortPseudonymChange() shall be called.]()

[SWS\_V2xM\_00104] [The modules that shall be notified with the two phase pseudonym change by V2xM are V2xGn and V2xFac.]()

**[SWS\_V2xM\_00105]** [The EthernetInterface and the Wireless Ethernet Driver do not support a two phase id change. Within the commit phase of the two phase pseudonym change, the API EthIf\_SetPhysAddr shall be called to initiate the pseudonym change within the Wireless Ethernet Driver. | ()

**[SWS\_V2xM\_00200]** [The maximum amount of pseudonyms per week shall be 100.] (SRS V2X 00174)

[SWS\_V2xM\_20177] The pseudonym used by the V2xM module shall change every time when the vehicle's ignition is switched on except if the system gets restarted within a period of 10 minutes, the pseudonym shall not be changed. | (SRS\_V2X\_10101)

**[SWS\_V2xM\_20409]** The pseudonym change after turning on ignition shall be performed within a grace period of 1 minute. (SRS V2X 10101)

[SWS\_V2xM\_20179] [Pseudonyms may be reused within their validity period.] (SRS\_-V2X\_10101)

**[SWS\_V2xM\_20402]** [The pseudonym validity periods shall not be longer than one week + overlapping period. | (SRS V2X 10101)

## 7.4 Security

**[SWS\_V2xM\_00009]** [The V2xM module shall provide the Encap and Decap services required by V2xGn and Verification On Demand (VOD) by utilizing CSM.] ()

**[SWS\_V2xM\_00175]** The V2xM shall disable CAM generation in case of unusable position (e.g. due to no position available, degenerated dead reckoning, time jitter/drift). This is done via a call to V2xFac\_V2xM\_SetCaBsOperation().]()

**[SWS\_V2xM\_20170]** [The V2xM module shall use for sending messages digital signatures and certificates based on ECDSA that is specified in IEEE 1609.2 as mentioned in [17].] (SRS\_V2X\_00163)

Note: Additionally, [18] requires implementation of the elliptic curve brainpool P256r1 to sign messages.

**[SWS\_V2xM\_00199]** The V2xM module shall support key origin authentication via the creation of a signature over internally generated public key(s), where public keys for Enrolment Certificates shall be signed with the module private key and public keys for Pseudonym Certificates shall be signed with a previously registered Enrolment Certificates private key. (SRS\_V2X\_00163, SRS\_V2X\_00174)

Note: The "module private key" is a vehicle specific unique private key that could be generated randomly inside the HSM when the ECU is initialized in the first place

**[SWS\_V2xM\_00135]** [The function V2xM\_V2xGn\_ReqEncap() shall encapsulate the payload of the GeoNetworking packet to be sent as defined in [19] and [17].] (SRS\_-V2X\_00406, SRS\_V2X\_00407)

[SWS\_V2xM\_00136] [The function V2xM\_V2xGn\_ReqDecap() shall decapsulate the payload of a received GeoNetworking packet as defined in [19] and [17]. | ()

[SWS\_V2xM\_00130] [The function V2xM\_V2xGn\_ReqDecap() shall invoke CSM APIs for the verification of the data given by SecuredDataPtr. | (SRS V2X 00163)

#### 7.5 Position and Time

**[SWS\_V2xM\_20191]** [WGS 84 shall be used as the reference coordinate system as defined in [20].

Altitude information shall be interpreted as height above WGS84 Ellipsoid. (SRS\_-V2X 00010)

**[SWS\_V2xM\_20192]** [Heading shall be interpreted as the direction of the horizontal velocity vector. The starting point of the velocity vector shall be the ITS Vehicle Reference Point as defined in CAM specification [21] B.19 (SRS V2X 00010)

[SWS\_V2xM\_00121] [The function V2xM\_GetPositionAndTime() shall provide the currently known position and time information. | ()

**[SWS\_V2xM\_00126]** [The function V2xM\_GetRefTimePtr() shall provide an address pointer to 32 bit data containing the current V2X Time, i.e. the TAI milliseconds from 2004-01-01 00:00:00.000 modulo 2<sup>32</sup>.|(SRS\_V2X\_00193)

**[SWS\_V2xM\_00177]** [The function V2xM\_CalcDistance() shall calculate the distance between two geographical points.] (SRS\_V2X\_00280)

**[SWS\_V2xM\_00179]** [The function V2xM\_CalcHeadingInTolerance() shall calculate if the difference of two heading values are within a given tolerance value. | ()

## 7.6 DCC Management

**[SWS\_V2xM\_20240]** [The V2xM module shall use the following smoothing function of channel busy ratio (CBR) values:

 $CBR_new = (CBR(n) + CBR(n-1))/2$ 

Where 'n' and 'n-1' are respectively the current and previous CBR sampling period as defined in [22], and with CBR() function as also defined in [22]. | (SRS V2X 00322)

#### [SWS\_V2xM\_20238] [

State	CBR	Packet rate (R)	T <sub>off</sub>
Relaxed	< 30 %	20 Hz	50 ms
Active_1	30 % to 39 %	10 Hz	100 ms
Active_2	40 % to 49 %	5 Hz	200 ms
Active_3	50 % to 65 %	4 Hz	250 ms
Restricted	> 65 %	1 Hz	1000 ms

The V2xM module shall use the reactive DCC algorithm outlined in Clause 5.3 of [19]. The table corresponds to Table A.2 in [19] with an average  $T_{on}$  of 500  $\mu$ s.

](SRS\_V2X\_00322)

**[SWS\_V2xM\_20293]** [The parameter T\_GenCam\_Dcc (see [21]) shall be set to the value of the minimum time between two transmissions,  $T_{off}$ , as given by the DCC Mechanism (see [SWS\_V2xM\_20238], and pushed to the V2xFac module via the V2xFac V2xM SetTGenCamDcc() API.|(SRS\_V2X\_00711)

**[SWS\_V2xM\_00188]** The current state (restrictive, active sub-state, relaxed, see [SWS\_V2xM\_20238]) shall be set periodically to the WEthTrcv Module to allow message bursts within the relaxed state. (SRS\_V2X\_00322)

**[SWS\_V2xM\_00189]** The current transmission interval (see [SWS\_V2xM\_20238]) shall be set periodically to the WEthTrcv Module to allow triggering of transmit queues. *(SRS\_V2X\_00322)* 

#### 7.7 Error Classification

Section "Error Handling" of the document [11] "General Specification of Basic Software Modules" describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

#### 7.7.1 Development Errors

#### [SWS V2xM 00031] Definition of development errors in module V2xM [

Type of error	Related error code	Error value
API service called with wrong parameter	V2XM_E_PARAM	0x01
API service called with invalid pointer	V2XM_E_PARAM_POINTER	0x02
V2xM initialization failed	V2XM_E_INIT_FAILED	0x03
API function called before the V2xM module has been fully initialized	V2XM_E_UNINIT	0x04

]()

#### 7.7.2 Runtime Errors

There are no runtime errors.

#### 7.7.3 Transient Faults

There are no transient faults.

#### 7.7.4 Production Errors

There are no production errors.

#### 7.7.5 Extended Production Errors

There are no extended production errors.

## 7.8 Security Events

The module does not report security events.

## 8 API specification

## 8.1 Imported types

In this chapter all types included from the following files are listed.

## [SWS\_V2xM\_00033] Definition of imported datatypes of module V2xM [

Module	Header File	Imported Type		
Csm	Rte_Csm_Type.h	Crypto_OperationModeType		
	Rte_Csm_Type.h	Crypto_VerifyResultType		
Gpt	Gpt.h	Gpt_ChannelType		
	Gpt.h	Gpt_PredefTimerType		
	Gpt.h	Gpt_ValueType		
N∨M	Rte_NvM_Type.h	NvM_BlockIdType		
	Rte_NvM_Type.h	NvM_RequestResultType		
StbM	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType		
	Rte_StbM_Type.h	StbM_TimeBaseStatusType		
	Rte_StbM_Type.h	StbM_TimeStampExtendedType (obsolete)		
	Rte_StbM_Type.h	StbM_TimeStampType		
	Rte_StbM_Type.h	StbM_TimeTupleType		
	Rte_StbM_Type.h	StbM_UserDataType		
	StbM.h	StbM_VirtualLocalTimeType		
Std	Std_Types.h	Std_ReturnType		
	Std_Types.h	Std_VersionInfoType		
V2x_GeneralTypes	Rte_V2xM_Type.h	V2xM_PositionAndTimeType		
	V2x_GeneralTypes.h	V2x_ChanType		
	V2x_GeneralTypes.h	V2x_PseudonymType		
	V2x_GeneralTypes.h	V2x_SecProfileType		
	V2x_GeneralTypes.h	V2x_SecReportType		
	V2x_GeneralTypes.h	V2x_SecReturnType		
WEthTrcv	WEth_GeneralTypes.h	WEthTrcv_GetChanRxParamIdType		
	WEth_GeneralTypes.h	WEthTrcv_SetChanRxParamIdType		
	WEth_GeneralTypes.h	WEthTrcv_SetChanTxParamIdType		
	WEth_GeneralTypes.h	WEthTrcv_SetRadioParamIdType		

10

## 8.2 Type definitions

**[SWS\_V2xM\_00107]**  $\lceil V2xM.h$  shall include  $V2x\_GeneralTypes.h$  for the inclusion of general V2X type declarations.  $\mid$  ()

#### 8.2.1 V2xM\_ConfigType

## [SWS\_V2xM\_00110] Definition of datatype V2xM\_ConfigType [

Name	V2xM_ConfigType			
Kind	Structure			
Elements	implementation specific	implementation specific		
	Type –			
	<b>Comment</b> The content of the configuration data structure is implementation specific.			
Description	Configuration data structure of the V2xM module.			
Available via	V2xM.h			

]()

### 8.2.2 V2x GnPacketTransportType

## [SWS\_V2xM\_00034] Definition of datatype V2x\_GnPacketTransportType [

Name	V2x_GnPacketTransportType			
Kind	Enumeration	Enumeration		
Range	V2X_GN_GEOUNICAST 0x00 -			
	V2X_GN_GEOANYCAST	0x01	_	
	V2X_GN_ 0x02 - GEOBROADCAST			
	V2X_GN_TSB	0x03	_	
	V2X_GN_SHB	0x04	-	
Description	Specifies the packet transport type for GeoNetworking packages. This is passed e.g. via V2xFac and V2xBtp for the transmit path.			
Available via	V2x_GeneralTypes.h			

10

## 8.2.3 V2x\_GnDestinationType

## [SWS\_V2xM\_00112] Definition of datatype V2x\_GnDestinationType [

Name	V2x_GnDestinationType		
Kind	Enumeration		
Range	V2X_GN_DESTINATION_ ADDRESS	0x00	-
	V2X_GN_DESTINATION_ AREA	0x01	_
Description	Specifies the destination type for GeoNetworking packages. This is passed e.g. via V2xFac and V2xBtp for the transmit path.		
Available via	V2x_GeneralTypes.h		

]()

#### 8.2.4 V2x\_GnAddressType

## [SWS\_V2xM\_00035] Definition of datatype V2x\_GnAddressType [

Name	V2x_GnAddressType
Kind	Туре
Derived from	uint64
Description	The GeoNetworking address.
Available via	V2x_GeneralTypes.h

|(SRS\_V2X\_00531)

#### 8.2.5 V2x\_GnAreaShapeType

## [SWS\_V2xM\_00113] Definition of datatype V2x\_GnAreaShapeType [

Name	V2x_GnAreaShapeType		
Kind	Enumeration		
Range	V2X_GN_SHAPE_CIRCLE 0x00 -		
	V2X_GN_SHAPE_RECT 0x01 -		
	V2X_GN_SHAPE_ELLIPSE	0x02	_
Description	Specifies the shape type for GeoNetworking Areas.		
Available via	V2x_GeneralTypes.h		

(SRS\_V2X\_00279)

#### 8.2.6 V2x\_GnDestinationAreaType

## [SWS\_V2xM\_00036] Definition of datatype V2x\_GnDestinationAreaType [

Name	V2x_GnDestinationAreaType			
Kind	Structure	Structure		
Elements	latitude			
Liements	Туре	sint32		
	Comment	Latitude [1/10 microdegree]		
	longitude			
	Туре	Type sint32		
	Comment Longitude [1/10 microdegree]			
	distanceA			
	Туре	uint16		
	Comment	Distance a of the geometric shape [meters]		
	distanceB  Type uint16			
	Comment	Distance b of the geometric shape [meters]		

 $\triangle$ 

	angle		
	Туре	uint16	
	Comment	Angle of the geometric shape [degrees from North]	
	shape		
	Туре	V2x_GnAreaShapeType  Shape type of the geometric area	
	Comment		
Description	Definition of the GeoNetworking destination area		
Available via	V2x_GeneralTypes.h		

]()

## 8.2.7 V2x\_GnTxResultType

## [SWS\_V2xM\_00114] Definition of datatype V2x\_GnTxResultType [

Name	V2x_GnTxResultType		
Kind	Enumeration		
Range	V2X_GNTX_ACCEPTED	_	GeoNetworking transmit has been accepted
	V2X_GNTX_E_ MAXSDUSIZEOVFL	_	GeoNetworking transmit has been rejected due to maximum length exceedance
	V2X_GNTX_E_ MAXPACKETLIFETIME	-	GeoNetworking transmit has been rejected due to maximum lifetime exceedance
	V2X_GNTX_E_TCID	_	GeoNetworking transmit has been rejected due to unsupported Traffic Class ID
	V2X_GNTX_E_ MAXGEOAREASIZE	-	GeoNetworking transmit has been rejected due to GeoArea exceeds max size
	V2X_GNTX_E_ UNSPECIFIED	_	GeoNetworking transmit has been rejected due to unspecified reasons
Description	The result code used to specify if a V2xGn_Transmit has been processed successfully.		
Available via	V2x_GeneralTypes.h		

]()

## 8.2.8 V2x\_SecProfileType

## [SWS\_V2xM\_00038] Definition of datatype V2x\_SecProfileType [

Name	V2x_SecProfileType				
Kind	Enumeration				
Range	V2X_SECPROF_CAM - Cam Security Profile				
	V2X_SECPROF_DENM – Denm Security Profile				
	V2X_SECPROF_OTHER_ SIGNED	-	Security Profile for other message types that have to be signed		

 $\triangle$ 

	V2X_SECPROF_OTHER_ SIGNED_EXTERNAL	_	Security Profile for other message types that are signed externally
	V2X_SECPROF_OTHER_ SIGNED_ENCRYPTED	_	Security Profile for other message types that have to be signed and encrypted
Description	Used to describe the security service invoked by V2xM		
Available via	V2x_GeneralTypes.h		

](SRS\_V2X\_00406)

#### 8.2.9 V2x\_SecReturnType

## [SWS\_V2xM\_00115] Definition of datatype V2x\_SecReturnType [

Name	V2x_SecReturnType			
Kind	Enumeration			
Range	V2X_E_OK	V2X_E_OK – Return with success		
	V2X_E_NOT_OK – Failure during operation			
	V2X_E_UNVERIFIED – Message has not been verified. Used for VoD			
	V2X_E_BUF_OVFL	_	Destination buffer too small for security operation data output	
Description	Used for return values of security related functions			
Available via	V2x_GeneralTypes.h			

10

## 8.2.10 V2x\_MaximumPacketLifetimeType

## [SWS\_V2xM\_00039] Definition of datatype V2x\_MaximumPacketLifetimeType [

Name	V2x_MaximumPacketLifetimeType		
Kind	Туре		
Derived from	uint16		
Range	06300 – Valid values		
	6301uint16 Max Value – Invalid		
Description	Specifies the maximum tolerable time (in seconds) a GeoNetworking packet can be buffered.		
Available via	V2x_GeneralTypes.h		

]()

## 8.2.11 V2x\_TrafficClassIdType

## [SWS\_V2xM\_00043] Definition of datatype V2x\_TrafficClassIdType [

Name	V2x_TrafficClassIdType		
Kind	Туре		
Derived from	uint8		
Range	063 – Valid values		
	64uint8 Max Value – Invalid		
Description	Requirements on packet transport coming from ITS Facilities layer		
Available via	V2x_GeneralTypes.h		

]()

## 8.2.12 V2x\_ChanType

## [SWS\_V2xM\_00044] Definition of datatype V2x\_ChanType [

Name	V2x_ChanType			
Kind	Enumeration	Enumeration		
Range	V2X_SCH4	V2X_SCH4 172 Service channel 4		
	V2X_SCH3	174	Service channel 3	
	V2X_SCH1	176	Service channel 1	
	V2X_SCH2	178	Service channel 2	
	V2X_CCH	180	Control channel	
Description	Specifies the channel type to use. Channels from ITS-G5A and ITS-G5B are used. Values matching IEEE 802.11-2012 channel numbers.			
Available via	V2x_GeneralTypes.h			

10

## 8.2.13 V2x\_GnUpperProtocolType

## [SWS\_V2xM\_00045] Definition of datatype V2x\_GnUpperProtocolType [

Name	V2x_GnUpperProtocolType			
Kind	Enumeration	Enumeration		
Range	V2X_ANY – Unspecified			
	V2X_BTPA	-	Transport protocol: BTP-A (for interactive packet transport).	
	V2X_BTPB	_	Transport protocol: BTP-B (for non-interactive packet transport).	
	V2X_IPV6	_	IPv6 header	
Description	Specifies the GeoNetworking payload.			
Available via	V2x_GeneralTypes.h			

]()

## 8.2.14 V2x\_GnLongPositionVectorType

## [SWS\_V2xM\_00046] Definition of datatype V2x\_GnLongPositionVectorType [

Name	V2x_GnLongPositionVec	V2x_GnLongPositionVectorType	
Kind	Structure		
	gnAddress		
Elements	Туре	V2x_GnAddressType	
	Comment	GeoNetworking Address	
	timestamp		
	Туре	uint32	
	Comment	Timestamp [ms]	
	latitude		
	Туре	sint32	
	Comment	Latitude [1/10 microdegree]	
	longitude		
	Туре	sint32	
	Comment	Longitude [1/10 microdegree]	
	pai		
	Туре	boolean	
	Comment	Positional accuracy indicator	
	speed		
	Туре	sint16	
	Comment	Speed [1/100 m/s]	
	heading		
	Туре	uint16	
	Comment	Heading [1/10 degrees]	
Description	Position-related informati	Position-related information as defined within [25] chapter 9.5.2.	
Available via	V2x_GeneralTypes.h		

]()

## 8.2.15 V2x\_PseudonymType

## [SWS\_V2xM\_00057] Definition of datatype V2x\_PseudonymType [

Name	V2x_PseudonymType
Kind	Туре
Derived from	uint64
Description	Pseudonym, derived from Pseudonym Certificates. The pseudonym is distributed to different modules to support privacy within the V2X System to the outside world.
Available via	V2x_GeneralTypes.h

10

## 8.2.16 V2x\_SecReportType

## [SWS\_V2xM\_00174] Definition of datatype V2x\_SecReportType [

Name	V2x_SecReportType		
Kind	Туре		
Derived from	uint8		
Range	V2X_SECREP_SUCCESS	0x00	Indicating security service has successfully executed
	V2X_SECREP_FALSE_ SIGNATURE	0x01	Indicating false signature
	V2X_SECREP_INVALID_ CERTIFICATE	0x02	Indicating invalid certificate
	V2X_SECREP_REVOKED_ CERTIFICATE	0x03	Indicating revoked certificate
	V2X_SECREP_ INCONSISTENT_CHAIN	0x04	Indicating inconsistent certificate chain
	V2X_SECREP_INVALID_ TIMESTAMP	0x05	Indicating invalid timestamp
	V2X_SECREP_ DUPLICATE_MESSAGE	0x06	Indicating duplicate message
	V2X_SECREP_INVALID_ MOBILITY_DATA	0x07	Indicating invalid mobility data
	V2X_SECREP_ UNSIGNED_MESSAGE	0x08	Indicating unsigned message
	V2X_SECREP_SIGNER_ CERTIFICATE_NOT_ FOUND	0x09	Indicating signer certificate not found
	V2X_SECREP_ UNSUPPORTED_SIGNER_ IDENTIFIER_TYPE	0x0a	Indicating unsupported signer identifier type
	V2X_SECREP_ INCOMPATIBLE_ PROTOCOL	0x0b	Indicating incompatible protocol
	V2X_SECREP_ UNENCRYPTED_ MESSAGE	0x0c	Indicating unencrypted message
	V2X_SECREP_ DECRYPTION_ERROR	0x0d	Indicating decryption error
	V2X_SECREP_NONE	0xff	Indicating no security service has been executed.
Description	Used to describe the security or decrypt)	report after invocation of securit	y services for Decapsulation (verify
Available via	V2x_GeneralTypes.h		

]()

## 8.3 Function definitions

This is a list of functions provided for upper layer modules and other V2X stack modules.

#### 8.3.1 V2xM Init

#### [SWS\_V2xM\_00070] Definition of API function V2xM\_Init [

Service Name	V2xM_Init		
Syntax	<pre>void V2xM_Init (    const void * CfgPtr )</pre>		
Service ID [hex]	0x01		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant		
Parameters (in)	CfgPtr	ConfigPtr Pointer to the selected configuration set.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Initializes the V2xM module.		
Available via	V2xM.h		

10

**[SWS\_V2xM\_00116]** [The function shall store the access to the configuration structure for subsequent API calls.] ()

[SWS\_V2xM\_00118] [The Configuration pointer CfgPtr shall always have a NULL PTR value | (SRS BSW 00414)

#### 8.3.2 V2xM GetVersionInfo

## [SWS\_V2xM\_00071] Definition of API function V2xM\_GetVersionInfo

Service Name	V2xM_GetVersionInfo	
Syntax	<pre>void V2xM_GetVersionInfo (    Std_VersionInfoType* VersionInfoPtr )</pre>	
Service ID [hex]	0x02	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	VersionInfoPtr Pointer to store the version information of this module.	
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Provides the version information of this module.	
Available via	V2xM.h	

10

[SWS\_V2xM\_00120] [If development error detection is enabled: the function shall check the parameter VersionInfoPtr for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER.]()

#### 8.3.3 V2xM\_GetPositionAndTime

#### [SWS\_V2xM\_00072] Definition of API function V2xM\_GetPositionAndTime

Service Name	V2xM_GetPositionAndTime		
Syntax	Std_ReturnType V2xM_GetPositionAndTime (     V2xM_PositionAndTimeType* Poti )		
Service ID [hex]	0x03		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	Poti Current position and time information including positional error information.		
Return value	Std_ReturnType		
Description	Provides the instantaneous position information.		
Available via	V2xM.h		

10

**[SWS\_V2xM\_00122]** [If development error detection is enabled: the function shall check that the service  $V2xM_{init}$ () was previously called. If the check fails, the function shall raise the development error  $V2xM_{equal}(I)$ 

[SWS\_V2xM\_00123] [If development error detection is enabled: the function shall check the parameter Poti for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER. | ()

#### 8.3.4 V2xM\_GetRefTimePtr

#### [SWS\_V2xM\_00125] Definition of API function V2xM\_GetRefTimePtr [

Service Name	V2xM_GetRefTimePtr		
Syntax	Std_ReturnType V2xM_GetRefTimePtr ( const uint32** RefTimePtr )		
Service ID [hex]	0x04		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	RefTimePtr	Pointer to the current time information.	
Return value	Std_ReturnType		
Description	Provides a pointer to the time reference of the V2X-Stack.		
Available via	V2xM.h		

10

**[SWS\_V2xM\_00127]** [If development error detection is enabled: the function shall check that the service  $V2xM_{init}$ () was previously called. If the check fails, the function shall raise the development error  $V2XM_{E_{init}}$ ()

[SWS\_V2xM\_00128] [If development error detection is enabled: the function shall check the parameter RefTimePtr for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER.]()

#### 8.3.5 V2xM\_V2xGn\_ReqEncap

#### [SWS\_V2xM\_00074] Definition of API function V2xM\_V2xGn\_ReqEncap

Service Name	V2xM_V2xGn_ReqEncap		
Syntax	V2x_SecReturnType V2xM_V2xGn_ReqEncap (     uint16 EncapReqId,     V2x_SecProfileType SecProfile,     uint16 UnsecuredDataLength,     const uint8* UnsecuredDataPtr,     uint16* SecuredDataLength,     uint8* SecuredDataPtr }		
Service ID [hex]	0x06		
Sync/Async	Asynchronous		
Reentrancy	Non Reentrant		
Parameters (in)	EncapReqId	Unique Id of the packet to be encapsulated with the signature of the transmitting ITS station	
	SecProfile	The security profile to use for encapsulation	
	UnsecuredDataLength	The length of the data to use for encapsulation	
	UnsecuredDataPtr The pointer to the data to use for encapsulation		
Parameters (inout)	SecuredDataLength	The length pointer containing the maximum length of secured data SecuredDataPtr at input direction. Shall contain the actual size of the secured data SecuredDataPtr at output direction.	
	SecuredDataPtr The pointer where the secured data shall be put.		
Parameters (out)	None		
Return value	V2x_SecReturnType	V2X_E_OK: request successful V2X_E_NOT_OK: request failed V2X_E_BUF_OVFL: SecuredDataLength is too small for security operation result data	
Description	This function is called by the V2xGn to sign and/or encrypt a message. An asynchronous V2x Gn_V2xM_EncapConfirmation call will be used to notify V2xGn of the result.		
Available via	V2xM_V2xGn.h		

#### (SRS V2X 00406, SRS V2X 00407)

**[SWS\_V2xM\_00131]** [If development error detection is enabled: the function shall check that the service  $V2xM_{init}$ () was previously called. If the check fails, the function shall raise the development error  $V2xM_{E_{init}}$  otherwise (if DET is disabled) return  $V2x_{E_{init}}$  or  $V2x_{E_{init}}$  of the return  $V2x_{E_{init}}$  or  $V2x_{E_{init}}$  of the return  $V2x_{E_{init}}$  or  $V2x_{E_{init}}$ 

[SWS\_V2xM\_00132] [If development error detection is enabled: the function shall check the parameter UnsecuredDataPtr for being valid. If the check fails, the func-

tion shall raise the development error  $V2XM\_E\_PARAM\_POINTER$  otherwise (if DET is disabled) return  $V2X\_E\_NOT\_OK.$  ) ()

**[SWS\_V2xM\_00133]** [If development error detection is enabled: the function shall check the parameter SecuredDataLength for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER otherwise (if DET is disabled) return V2X\_E\_NOT\_OK. | ()

**[SWS\_V2xM\_00134]** [If development error detection is enabled: the function shall check the parameter SecuredDataPtr for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER otherwise (if DET is disabled) return V2X\_E\_NOT\_OK.]()

#### 8.3.6 V2xM\_V2xGn\_ReqDecap

#### [SWS V2xM 00075] Definition of API function V2xM V2xGn RegDecap

Service Name	V2xM_V2xGn_ReqDecap	V2xM_V2xGn_ReqDecap		
Syntax	<pre>V2x_SecReturnType V2xM_V2xGn_ReqDecap (     uint32 DecapReqId,     uint16 SecuredDataLength,     const uint8* SecuredDataPtr,     uint16* UnsecuredDataLength,     uint8* UnsecuredDataPtr,     V2x_SecReportType* SecReport,     uint64* CertificateId,     uint32* ItsAid,     uint8* SspLength,     uint8* SspBits )</pre>			
Service ID [hex]	0x07			
Sync/Async	Asynchronous			
Reentrancy	Non Reentrant	Non Reentrant		
Parameters (in)	DecapReqld	Unique Id of the packet to be decapsulated		
	SecuredDataLength	The length of the data to decrypt and verify		
	SecuredDataPtr	The pointer to the data to decrypt and verify		
Parameters (inout)	UnsecuredDataLength	The pointer to the data length of the unsecured data. Shall contain the maximum available length (incoming direction) and the actual used length (outgoing direction)		
	UnsecuredDataPtr	The pointer where the decrypted /verified data shall be put		
	SecReport	The security report.		
	CertificateId	The identification of the used for verification (by certificate hash)		
	ItsAid	The numerical value of the ITS-AID		
	SspLength	The length (in octets, up to 31) of the SSP bits		
	SspBits	The SSP bits		
Parameters (out)	None			

#### Δ

Return value	V2x_SecReturnType	V2X_E_OK: request successful V2X_E_NOT_OK: request failed V2X_E_UNVERIFIED: VOD is being used V2X_E_BUF_OVFL: UnsecuredDataLength is too small for security operation result data
Description	This function is called by the V2xGn to decrypt and verify a message. An asynchronous V2x Gn_V2xM_DecapConfirmation call will be used to notify V2xGn of the result.	
Available via	V2xM_V2xGn.h	

10

**[SWS\_V2xM\_00137]** [If development error detection is enabled: the function shall check that the service  $V2xM_{init}$ () was previously called. #### 8.3.7 V2xM\_TriggerPseudonymChange

## [SWS\_V2xM\_00077] Definition of API function V2xM\_TriggerPseudonymChange

Service Name	V2xM_TriggerPseudonymChange		
Syntax	Std_ReturnType V2xM_TriggerPseudonymChange (    void )		
Service ID [hex]	0x08		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType	E_OK: request successful E_NOT_OK: request failed	
Description	This function is called by the V2xFac, V2xGn or another entity to change the Pseudonym used by the V2X-Stack, e.g. due to a GeoNetworking address conflict.		
Available via	V2xM.h		

 $\rfloor ()$ 

**[SWS\_V2xM\_00142]** The function V2xM\_TriggerPseudonymChange() shall trigger the pseudonym change and update the identity of the V2X-Stack to the adjacent modules. ()

[SWS\_V2xM\_00143] [If development error detection is enabled: the function shall check that the service V2xM\_Init() was previously called. If the check fails, the function shall raise the development error V2XM\_E\_UNINIT.|()

**[SWS\_V2xM\_00144]** If the pseudonym change is locked  $V2X_E_NOT_OK$  shall be returned.] ()

### 8.3.8 V2xM LockPseudonymChange

### [SWS\_V2xM\_00078] Definition of API function V2xM\_LockPseudonymChange

Service Name	V2xM_LockPseudonymCha	V2xM_LockPseudonymChange	
Syntax	<pre>Std_ReturnType V2xM_LockPseudonymChange (    uint16 Duration,    uint64* HandleId )</pre>		
Service ID [hex]	0x09	0x09	
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	Duration	Number of seconds to lock	
Parameters (inout)	None		
Parameters (out)	Handleld	Handle to unlock manually	
Return value	Std_ReturnType	E_OK: request successful E_NOT_OK: request failed	
Description	This function is called by V2xGn or from the Application Service Interface to lock the pseudonym change.		
Available via	V2xM.h		

10

[SWS\_V2xM\_00145] [The function V2xM\_LockPseudonymChange() shall prevent the module from changing the pseudonym. The requirements from [23] shall apply.] ()

[SWS\_V2xM\_00146] [If development error detection is enabled: the function shall check that the service V2xM\_Init() was previously called. If the check fails, the function shall raise the development error V2XM\_E\_UNINIT.|()

[SWS\_V2xM\_00147] [If development error detection is enabled: the function shall check the parameter HandleId for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER.|()

#### 8.3.9 V2xM UnlockPseudonymChange

# [SWS\_V2xM\_00079] Definition of API function V2xM\_UnlockPseudonymChange

Service Name	V2xM_UnlockPseudo	V2xM_UnlockPseudonymChange	
Syntax		Std_ReturnType V2xM_UnlockPseudonymChange (     uint64 HandleId )	
Service ID [hex]	0x0a	0x0a	
Sync/Async	Synchronous	Synchronous	
Reentrancy	Reentrant	Reentrant	
Parameters (in)	Handleld	Handle to unlock manually, available from LockPseudonym Change function.	
Parameters (inout)	None	None	

Parameters (out)	None		
Return value	Std_ReturnType	E_OK: request successful E_NOT_OK: request failed	
Description	This function is called by V2xGn or from the Application Service Interface to unlock the pseudonym change.		
Available via	V2xM.h	V2xM.h	

10

[SWS\_V2xM\_00149] [The function V2xM\_UnlockPseudonymChange() shall allow the module to change the pseudonym again.] ()

[SWS\_V2xM\_00150] [If development error detection is enabled: the function shall check that the service V2xM\_Init() was previously called. If the check fails, the function shall raise the development error V2XM\_E\_UNINIT.|()

[SWS\_V2xM\_00151] [If development error detection is enabled: the function shall check the parameter HandleId for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM. | ()

### 8.3.10 V2xM\_V2xGn\_SetGlobalRxParams

# [SWS\_V2xM\_00080] Definition of API function V2xM\_V2xGn\_SetGlobalRx Params [

Service Name	V2xM_V2xGn_SetGlobalRx	Params
Syntax	<pre>void V2xM_V2xGn_SetGlobalRxParams (    const uint16* Cbr_Gs,    const V2x_ChanType* Channel )</pre>	
Service ID [hex]	0x0b	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Cbr_Gs	List of current channel busy values
	Channel	List of channel types to that the busy values belong to
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This function is called by V2xGn to set the current channel busy percentage for the specified channel	
Available via	V2xM_V2xGn.h	

10

[SWS\_V2xM\_00154] [If development error detection is enabled: the function shall check that the service V2xM\_Init() was previously called. If the check fails, the function shall raise the development error V2XM\_E\_UNINIT.|()

[SWS\_V2xM\_00155] [If development error detection is enabled: the function shall check the parameter Cbr\_Gs for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER.]()

[SWS\_V2xM\_00156] [If development error detection is enabled: the function shall check the parameter Channel for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER.] ()

### 8.3.11 V2xM\_V2xGn\_GetGlobalTxParams

# [SWS\_V2xM\_00081] Definition of API function V2xM\_V2xGn\_GetGlobalTx Params

Service Name	V2xM_V2xGn_GetGlobalTx	(Params
Syntax	<pre>void V2xM_V2xGn_GetGlobalTxParams (    const V2x_ChanType* channel,    uint16* Cbr )</pre>	
Service ID [hex]	0x0c	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	channel	List of channels
Parameters (inout)	None	
Parameters (out)	Cbr	List of current channel busy values (in tenths of a percent) for the specified channel type
Return value	None	
Description	This function is called by V2xGn to get the current channel busy percentage for the specified channel	
Available via	V2xM_V2xGn.h	

10

**[SWS\_V2xM\_00158]** [The function V2xM\_V2xGn\_GetGlobalTxParams() shall change provide a list with CBR values for the specific list of channels.] ()

**[SWS\_V2xM\_00159]** [If development error detection is enabled: the function shall check that the service  $V2xM_{init}$ () was previously called. If the check fails, the function shall raise the development error  $V2xM_{E_{init}}$ ()

**[SWS\_V2xM\_00160]** [If development error detection is enabled: the function shall check the parameter Cbr for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER.] ()

[SWS\_V2xM\_00161] [If development error detection is enabled: the function shall check the parameter channel for being valid. If the check fails, the function shall raise the development error V2XM\_E\_PARAM\_POINTER.]()

### 8.3.12 V2xM CalcDistance

### [SWS\_V2xM\_00176] Definition of API function V2xM\_CalcDistance

Service Name	V2xM_CalcDistance	
Syntax	<pre>Std_ReturnType V2xM_CalcDistance (     sint32 LatitudeA,     sint32 LongitudeA,     sint32 LatitudeB,     sint32 LongitudeB,     float32* Distance )</pre>	
Service ID [hex]	0x0e	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	LatitudeA Latitude of geographical point A	
	LongitudeA	Longitude of geographical point A
	LatitudeB	Latitude of geographical point B
	LongitudeB	Longitude of geographical point B
Parameters (inout)	None	
Parameters (out)	Distance Distance between geographical points A and B [m]	
Return value	Std_ReturnType	E_OK: Calculation ok E_NOT_OK: Calculation failed, input parameters out of range
Description	Calculates the distance between two geographical points on earth with the assumption that they are on elevation 0.	
Available via	V2xM.h	

### ](SRS\_V2X\_00280)

[SWS\_V2xM\_00181] [If development error detection is enabled: the function shall check the parameter <code>Distance</code> for being valid. If the check fails, the function shall raise the development error <code>V2XM\_E\_PARAM\_POINTER.</code>]()

### 8.3.13 V2xM\_CalcHeadingInTolerance

## [SWS\_V2xM\_00178] Definition of API function V2xM\_CalcHeadingInTolerance

Service Name	V2xM_CalcHeadingInTolera	V2xM_CalcHeadingInTolerance	
Syntax	<pre>boolean V2xM_CalcHeadingInTolerance (   float32 Heading1,   float32 Heading2,   float32 Tolerance )</pre>		
Service ID [hex]	0x0f	0x0f	
Sync/Async	Synchronous		
Reentrancy	Reentrant	Reentrant	
Parameters (in)	Heading1	First heading value	
	Heading2 Second heading value		
	Tolerance	Tolerance Allowed tolerance between heading values	

Parameters (inout)	None	
Parameters (out)	None	
Return value	boolean TRUE: diff of headings is within tolerance FALSE: diff of headings is outside tolerance	
Description	Calculates if difference of heading values are within a tolerance value	
Available via	V2xM.h	

10

### 8.3.14 V2xM\_SetTollingZoneInformation

# [SWS\_V2xM\_00182] Definition of API function V2xM\_SetTollingZoneInformation

Service Name	V2xM_SetTollingZoneInfor	mation	
Syntax	sint32 protectedZo sint32 protectedZo uint32 protectedZo	<pre>void V2xM_SetTollingZoneInformation (    sint32 protectedZoneLatitude,    sint32 protectedZoneLongitude,    uint32 protectedZoneRadius,    uint8 protectedZoneID )</pre>	
Service ID [hex]	0x10	0x10	
Sync/Async	Synchronous	Synchronous	
Reentrancy	Reentrant	Reentrant	
Parameters (in)	protectedZoneLatitude	Latitude of the tolling zone	
	protectedZoneLongitude	Longitude of the tolling zone	
	protectedZoneRadius	protectedZoneRadius radius of the protected zone in meter, use default value of 55m in not known	
	protectedZoneID	ID of the tolling zone, use 0xFFFFFFF if not known	
Parameters (inout)	None	None	
Parameters (out)	None	None	
Return value	None	None	
Description	Set available tolling zone in via CAM messages.	Set available tolling zone information. This is done from V2xFac that receives this information via CAM messages.	
Available via	V2xM.h		

10

**[SWS\_V2xM\_00190]** [The V2xM Module shall check the provided positional information. In case of a distance less than given in protectedZoneRadius, tolling zone power reduction shall be enabled.]()

**[SWS\_V2xM\_00170]** [Used for handling of tolling zone power reduction.

If the distance to a Tolling Zone position given by V2xM\_SetTollingZoneInformation is less than the distance given in protectedZoneRadius, the module shall push that to the WEthTrcv via the API EthIf\_SetRadioParams so that WEthTrcv is able to reduce output power of specific packets. If the position drops out of the range, tolling zone power reduction shall be switched off. \( \)()

**[SWS\_V2xM\_20460]** The V2X Management module shall implement a protected zone center position list. The minimum is to build in the official list provided by the ASECAP (not supposed to be updated except by a firmware update).

Protected Zones with identical protectedZone ID may be seen as a single station. In case the ASECAP database and the CEN-DSRC mitigation CAMs contains a valid protection zone with the identical protectedZone ID mitigation shall be done only based on the CEN-DSRC mitigation CAM content. | ()

## 8.3.15 V2xM\_Vdp\_GetNextLongTermCertificateExpirationDate

# [SWS\_V2xM\_91001] Definition of API function V2xM\_Vdp\_GetNextLongTermCertificateExpirationDate $\lceil$

Service Name	V2xM_Vdp_GetNextLongTermCertificateExpirationDate	
Syntax	<pre>Std_ReturnType V2xM_Vdp_GetNextLongTermCertificateExpirationDate (     uint32* ExpirationDate )</pre>	
Service ID [hex]	0x12	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	ExpirationDate	Date is based on format Time32 that is specified in IEEE 1609.2 as mentioned in [19].
Return value	Std_ReturnType	E_OK: Provided value is valid. E_NOT_OK: Operation failed, provided value is not reliable.
Description	Service to get the certificate expiration date of the long term certificate that expires in the nearest future.	
Available via	V2xM.h	

 $\rfloor ()$ 

**[SWS\_V2xM\_00202]** [The function V2xM\_Vdp\_GetNextLongTermCertificateExpirationDate shall check for the currently used long-term certificate (aka. Enrolment Credentials (EC)). If none was found, the function shall return E\_NOT\_OK. If a long-term certificate is in use, the expiration date of this certificate shall be provided through the parameter ExpirationDate and the function shall return E\_OK.|()

## 8.3.16 V2xM\_Vdp\_GetNextPseudonymCertificateExpirationDate

# [SWS\_V2xM\_91002] Definition of API function V2xM\_Vdp\_GetNextPseudonym CertificateExpirationDate $\lceil$

Service Name	V2xM_Vdp_GetNextPseudo	onymCertificateExpirationDate
Syntax	<pre>Std_ReturnType V2xM_Vdp_GetNextPseudonymCertificateExpirationDate (    uint32* expirationDate )</pre>	
Service ID [hex]	0x13	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	expirationDate	Date is based on format Time32 that is specified in IEEE 1609.2 as mentioned in [19].
Return value	Std_ReturnType	E_OK: Provided value is valid. E_NOT_OK: Operation failed, provided value is not reliable.
Description	Service to get the certificate expiration date of the pseudonym certificate that expires in the nearest future.	
Available via	V2xM.h	

10

[SWS\_V2xM\_00203] [The function V2xM\_Vdp\_GetNextPseudonymCertificateExpirationDate shall check for the currently used pseudonym certificate (aka. Authorization Tickets (AT)). If none was found, the function shall return E\_NOT\_OK. If a pseudonym certificate is in use, the expiration date of this certificate shall be provided through the parameter expirationDate and the function shall return E\_OK.|()

### 8.3.17 V2xM Vdp SetPositionAndTime

## [SWS\_V2xM\_91003] Definition of API function V2xM\_Vdp\_SetPositionAndTime [

Service Name	V2xM_Vdp_SetPositionAndTime		
Syntax	<pre>Std_ReturnType V2xM_Vdp_SetPositionAndTime (     V2xM_PositionAndTimeType PositionAndTime )</pre>		
Service ID [hex]	0x14	0x14	
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	PositionAndTime	Current position and time.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType	E_OK: Position and time successfully set. E_NOT_OK: Failed to set position and time.	
Description	Service for setting positional and time information relevant for the V2X-Stack		
Available via	V2xM.h		

]()

**[SWS\_V2xM\_00204]** [The current position and time of the vehicle shall be set through the function V2xM\_Vdp\_SetPositionAndTime. If the values are accepted by the function, E\_OK shall be returned, otherwise the value E\_NOT\_OK shall be returned.] ()

### 8.3.18 V2xM GetTime

### [SWS\_V2xM\_91004] Definition of API function V2xM\_GetTime

Service Name	V2xM_GetTime	V2xM_GetTime	
Syntax		Std_ReturnType V2xM_GetTime (     uint32* CurrentItsTime )	
Service ID [hex]	0x15		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	CurrentItsTime	Current ITS Time in ms as estimated by the V2X stack (Number of milliseconds since 2004-01-01T00:00:00.000Z, as specified in ISO 8601, which means that the leap seconds are inserted).	
Return value	Std_ReturnType		
Description	Service for getting the ITS time as estimated by the V2X-Stack		
Available via	V2xM.h		

10

**[SWS\_V2xM\_00205]** [The current ITS time of the vehicle shall be retrieved through the function  $V2xM\_GetTime$ . If ITS time was successfully retrieved by the function, E\_OK shall be returned, otherwise the value E\_NOT\_OK shall be returned.] ()

### 8.4 Callback notifications

#### 8.4.1 CSM callback interfaces

**[SWS\_V2xM\_00163]** [If the V2xM module uses the Csm module asynchronously to calculate or verify the signatures, V2xM shall provide callback functions according to Csm\_CallbackType.]  $(SRS_BSW_00457)$ 

#### 8.5 Scheduled functions

### 8.5.1 V2xM MainFunction

### [SWS\_V2xM\_00164] Definition of scheduled function V2xM\_MainFunction [

Service Name	V2xM_MainFunction	
Syntax	void V2xM_MainFunction (	
	)	
Service ID [hex]	0x0D	
Description	Scheduled MainFunction of V2xM	
Available via	SchM_V2xM.h	

10

**[SWS\_V2xM\_00165]** [Used for polling DCC information via EthIf\_GetChanRxParamsAPI() call from Wireless Ethernet Transceiver Driver.]

[SWS\_V2xM\_00166] [Used for cyclic pseudonym change. | ()

**[SWS\_V2xM\_00167]** [Used for pushing DCC information to adjacent V2X modules.]

**[SWS\_V2xM\_00168]** [Used for polling state of asynchronous security functions of CSM.] ()

**[SWS\_V2xM\_00169]** [Used for automatic unlocking of pseudonym changes if locking interval is due.]()

# 8.6 Expected interfaces

In this chapter all interfaces required from other modules are listed.

### 8.6.1 Mandatory interfaces

This chapter defines all external interfaces which are required to fulfill the core functionality of the module.

# [SWS\_V2xM\_00092] Definition of mandatory interfaces in module V2xM [

API Function	Header File	Description
Csm_Hash	Csm.h	Uses the given data to perform the hash calculation and stores the hash.
Csm_KeyElementGet	Csm.h	Retrieves the key element bytes from a specific key element of the key identified by the keyld and stores the key element in the memory location pointed by the key pointer.
Csm_KeyElementSet	Csm.h	Sets the given key element bytes to the key identified by keyld.
Csm_RandomGenerate	Csm.h	Generate a random number and stores it in the memory location pointed by the result pointer.
Csm_SignatureGenerate	Csm.h	Uses the given data to perform the signature calculation and stores the signature in the memory location pointed by the result pointer.
Csm_SignatureVerify	Csm.h	Verifies the given MAC by comparing if the signature is generated with the given data.
EthIf_GetChanRxParams	Ethlf.h	Read values related to the receive direction of the transceiver. For example, this could be a Channel Busy Ratio (CBR) or the average Channel Idle Time (CIT).
EthIf_SetChanRxParams	Ethlf.h	Set values related to the receive direction of a transceiver's wireless channel. For example, this could be a channel parameter like the frequency.
EthIf_SetChanTxParams	Ethlf.h	Set values related to the transmit direction of a transceiver's wireless channel. For example, this could be the bitrate of a channel.
Ethlf_SetPhysAddr	Ethlf.h	Sets the physical source address used by the indexed controller.
EthIf_SetRadioParams	Ethlf.h	Set values related to a transceiver's wireless radio. For example, this could be the selection of the radio settings (channel,).
NvM_GetErrorStatus	NvM.h	Service to read the block dependent error/status information.
NvM_ReadBlock	NvM.h	Service to copy the data of the NV block to its corresponding RAM block.
NvM_WriteBlock	NvM.h	Service to copy the data of the RAM block to its corresponding NV block.
V2xFac_V2xM_AbortPseudonym Change	V2xFac_V2xM.h	This function is called by the V2xM when not all modules are OK with the pseudonym change and the change is to be rolled back.
V2xFac_V2xM_CommitPseudonym Change	V2xFac_V2xM.h	This function is called by the V2xM when all modules are OK with the pseudonym change and the change is to be committed.
V2xFac_V2xM_PreparePseudonym Change	V2xFac_V2xM.h	By this API primitive the V2xFac module gets an indication that the given Pseudonym and hereby the StationId is about to be changed
V2xFac_V2xM_SetCaBsOperation	V2xFac_V2xM.h	By this API primitive the V2xFac module gets an indication of the current operation state of the CA Basic Service.
V2xFac_V2xM_SetTGenCamDcc	V2xFac_V2xM.h	By this API primitive the V2xFac module gets an indication of the current TGenCamDcc value.
V2xGn_V2xM_AbortPseudonym Change	V2xGn_V2xM.h	This function is called by the V2xM when not all modules are OK with the pseudonym change and the change is to be rolled back.

API Function	Header File	Description
V2xGn_V2xM_CommitPseudonym Change	V2xGn_V2xM.h	This function is called by the V2xM when all modules are OK with the pseudonym change and the change is to be committed.
V2xGn_V2xM_DecapConfirmation	V2xGn_V2xM.h	This function is called by the V2xM when a decapsulation has been finished.
V2xGn_V2xM_EncapConfirmation	V2xGn_V2xM.h	This function is called by the V2xM when an encapsulation has been finished.
V2xGn_V2xM_PreparePseudonym Change	V2xGn_V2xM.h	This function is called by the V2xM when a Pseudonym Change occurs to prepare the change in every module using it.

]()

# 8.6.2 Optional interfaces

This chapter defines all external interfaces which are required to fulfill an optional functionality of the module.

# [SWS\_V2xM\_00093] Definition of optional interfaces in module V2xM [

API Function	Header File	Description
Det_ReportError	Det.h	Service to report development errors.
Efx_ArcCos_s32_u32	Efx.h	This service computes the inverse cosine of a value.
Efx_ArcSin_s32_s32	Efx.h	This service computes the inverse sine of a value.
Efx_Cos_s32_s32	Efx.h	This service computes the cosine of an angle.
Efx_Sin_s32_s32	Efx.h	This service computes the sine of an angle.
Efx_Sqrt_u32_u32	Efx.h	This service computes the square root of a value
Gpt_GetPredefTimerValue	Gpt.h	Delivers the current value of the desired GPT Predef Timer.
Gpt_StartTimer	Gpt.h	Starts a timer channel.
Mfl_ArcCos_f32	Mfl.h	Returns the arc cosine of an angle, in the range of 0.0 through pi.
Mfl_ArcSin_f32	Mfl.h	Returns the arc sine of an angle, in the range of -pi/2 through pi/2.
Mfl_Cos_f32	Mfl.h	Calculates the cosine of the argument.
Mfl_Sin_f32	Mfl.h	Calculates the sine of the argument.
Mfl_Sqrt_f32	Mfl.h	Returns the square root of the operand (ValSqrt), determined according to the following equation
StbM_GetCurrentTime	StbM.h	Returns a time tuple (Local time, Global time and Timebase status) and user data details Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).

API Function	Header File	Description
StbM_GetCurrentTimeExtended (obsolete)	StbM.h	Returns a time value (Local Time Base derived from Global Time Base) in extended format.
		Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).

# 8.7 Service Interfaces

### 8.7.1 Client-Server-Interfaces

# 8.7.1.1 V2xM\_Vdp

# [SWS\_V2xM\_00095] Definition of ClientServerInterface V2xM\_Vdp [

Name	V2xM_Vdp			
Comment	Interfaces for Vehicle Data Provider (VDP) to get and set V2X related vehicle information in the BSW V2X-Stack			
IsService	true	true		
Variation	-			
Possible Errors	0	E_OK	Operation successful	
	1	E_NOT_OK	Operation failed	

Operation	GetNextLongTermCertificateExpirationDate	
Comment	Service to get the certificate expiration date of the long term certificates that expires in the nearest future.	
Mapped to API	V2xM_Vdp_Ge	etNextLongTermCertificateExpirationDate
Variation	-	
Parameters	ExpirationDate	
	Type uint32	
	<b>Direction</b> OUT	
	Comment	Date is based on format Time32 that is specified in IEEE 1609.2 as mentioned in [19].
	Variation –	
Possible Errors	E_OK E_NOT_OK	

Operation	GetNextPseudonymCertificateExpirationDate
Comment	Service to get the certificate expiration date of the pseudonym certificates that expires in the nearest future.
Mapped to API	V2xM_Vdp_GetNextPseudonymCertificateExpirationDate
Variation	-
Parameters	ExpirationDate

	Туре	uint32
	Direction	OUT
	Comment	Date is based on format Time32 that is specified in IEEE 1609.2 as mentioned in [19]
	Variation	-
Possible Errors	E_OK E_NOT_OK	

Operation	GetTime32	
Comment	Service to get	the current reference time.
Mapped to API	V2xM_GetTime	е
Variation	_	
Parameters	Time32	
	Туре	uint32
	Direction OUT	
	Comment	Time is based on TAI mod 2^32, where TAI is the number of elapsed TAI milliseconds since 2004-01-01 00:00:00.000.
	Variation	-
Possible Errors	E_OK E_NOT_OK	

Operation	SetPositionAndTime		
Comment	Service for set	ting positional and time information relevant for the V2X-Stack	
Mapped to API	V2xM_Vdp_Se	etPositionAndTime	
Variation	_		
Parameters	positionAndTime		
	Туре	Type V2xM_PositionAndTimeType	
	Direction IN		
	Comment -		
	Variation –		
Possible Errors	E_OK E_NOT_OK

# 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module V2xM.

Chapter 10.3 specifies published information of the module V2xM.

# 10.1 How to read this chapter

For details refer to the chapter 10.1 "Introduction to configuration specification" in [11].

# 10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapter 7 and Chapter 8.

#### 10.2.1 Variants

**[SWS\_V2xM\_00191]** [The V2xM module only supports VARIANT-PRE-COMPILE] (SRS\_BSW\_00345)

#### 10.2.2 V2xM

SWS Item	[ECUC_V2xM_00016]	
Module Name	V2xM	
Description	Configuration of the V2xM (V2XManagement) module.	
Post-Build Variant Support	false	
Supported Config Variants	VARIANT-PRE-COMPILE	

Included Containers				
Container Name	Multiplicity	Scope / Dependency		
V2xMConfig	1	This container contains the configuration parameters and sub containers of the AUTOSAR V2xM module.		
V2xMGeneral	1	General configuration of V2xM module.		

# 10.2.3 V2xMConfig

SWS Item	[ECUC_V2xM_00001]
Container Name	V2xMConfig
Parent Container	V2xM
Description	This container contains the configuration parameters and sub containers of the AUTOSAR V2xM module.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
V2xMSecurityConfig	1	Configuration of the security services of V2xM.

# 10.2.4 V2xMSecurityConfig

SWS Item	[ECUC_V2xM_00002]	
Container Name	V2xMSecurityConfig	
Parent Container	V2xMConfig	
Description	Configuration of the security services of V2xM.	
Configuration Parameters		

SWS Item	[ECUC_V2xM_00005]			
Parameter Name	V2xMSecurityVerificationOnDemand			
Parent Container	V2xMSecurityConfig			
Description	Switches the Verification on Demand	d (VoD) C	ON or OFF.	
	• true: enabled (ON)			
	• false: disabled (OFF)			
Multiplicity	1	1		
Туре	EcucBooleanParamDef			
Default value	-			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	X	All Variants	
	Link time	_		
	Post-build time	_		
Scope / Dependency	scope: local			

SWS Item	[ECUC_V2xM_00004]			
Parameter Name	V2xMSecurityNvMBlockDescriptorL	V2xMSecurityNvMBlockDescriptorLongTermCertificates		
Parent Container	V2xMSecurityConfig	V2xMSecurityConfig		
Description	Reference to NVRAM block contains	Reference to NVRAM block containing the none volatile data of long term certificates.		
Multiplicity	1			
Туре	Symbolic name reference to NvMBlockDescriptor			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Х	All Variants	
	Link time	_		

	Post-build time	_	
Scope / Dependency	scope: local		

SWS Item	[ECUC_V2xM_00003]			
Parameter Name	V2xMSecurityNvMBlockDescriptorP	V2xMSecurityNvMBlockDescriptorPseudonymCertificates		
Parent Container	V2xMSecurityConfig			
Description	Reference to NVRAM block containing	ing the no	ne volatile data of pseudonym certificates.	
Multiplicity	1	1		
Туре	Symbolic name reference to NvMBlockDescriptor			
Post-Build Variant Value	false
